Basic-Line AXN

Product description

High performance and low costs are the outstanding features of this model range. If individual module or multi system: Depending on customers' requirements various combinations are possible.

Toothed belt

For space and cost reasons the modules are equipped with toothed belt tension located below the table plate. By positive belt retainer the toothed belt is getting tension and laterally security.

Roller guide

The characteristic features of the roller guide are cost-saving, nearly maintenance-free concomitant with high-performance. Resistance to soiling and smooth running is achieved by rollers of large dimensions.

Universal motor connection

Economic and space-saving solution by direct gearbox connection. Drive end of the gear is equipped with hollow-shaft connection. Alternatively, almost all common flange motors can be connected by metal bellow or elastomer claw couplings with the corresponding motor adapters.

Basic-Line AXN

Product description

Integrated wiper brushes

The actuator profile of the basic line modules is covered on the upper side by the circular toothed belt. Wiper brushes integrated in the head covers prevent effectively larger dirt particles from penetrating into the profile.

Assembly and fixation of the actuator

Two longitudinal T-slots in the table plates (thread at AXN 45) make it easily possible to install the moving parts. By end-to-end T-slots at the bottom and on either side of the actuator a universal installation of the module is possible. In this application adequate swivelling sliding blocks with spring element can be supplied (for AXN 80 and AXN 100 also DIN slot nuts).

Lifetime lubrication

The bearings of the rollers and the belt pinions are lubricated for life. At any movement the steel shafts or the roller guides are coated by a thin lubricant film, coming from an integrated system. For short-stroke use, strokes $\leq \frac{1}{2}$ length of carriage, please contact our Technical support. In case of high travel mileage and/or acceleration values it is possible to refill this system through lubricating nipples in the table plate.

Recommended lubricant: Klüber Lamora D220)

Basic-Line AXNP^{lus}

Product description

The new range of AXNP modules is a further development of our successful AXN modules with toothed drive belt. These units have been developed especially for quick handling and positioning functions. If individual or multi system – depending on customers' requirements various combinations are possible, even a combination with the AXN module range is possible.

Toothed drive belt

AT-type belt, reinforced with steel cords, allows transfer of large drag forces and guarantees a long lifetime. The belt tension is located in the crosshead.

Roller guide / Rail guide

The characteristic features of the roller guide are cost-saving, nearly maintenance-free concomitant with high-performance. Resistance to soiling and smooth running is achieved by rollers of large dimensions. The use of two eccentric bearings guarantees that the guides can optimally be pre-loaded and mounted completely free of clearance. The dynamic working load is based on a nominal lifetime of 54.000 km.

As an alternative, these actuators can also be equipped with recirculating ball guides or guides in caged-ball technology. The advantages of these rail guides are long lifetime, low noise, high accuracy and high loads. For a statically cycling of the guide systems the dynamic loads are relevant.

Universal motor connection

Economic and space-saving solution by direct gearbox connection. Drive end of the gear is equipped with hollow-shaft connection. Alternatively, almost all common flange motors can be connected by metal bellow or elastomer claw couplings with the corresponding motor adapters.

Product description

Dirt protection

The actuator profile of the basic line modules AXNP contains a cover band which covers the profile completely on the upper side. Therefore, dirt particles can not enter into the actuator. In addition, wiper brushes integrated in the head covers prevent effectively larger dirt particles from penetrating into the profile. Of course all actuators can also be delivered without cover band.

Assembly and fixation of the actuator

By roll-in T-slots, fastening shoulder and connection plates a universal installation of the module is possible. In this application adequate spring sliding blocks with spring element can be supplied.

Lifetime lubrication

The bearings of the rollers and the belt pinions are lubricated for life. At any movement the steel shafts or the roller guides are coated by a thin lubricant film, coming from an integrated system.

For short-stroke use, strokes $\leq \frac{1}{2}$ length of carriage, please contact our Technical support. In case of high travel mileage and/or acceleration values it is possible to refill this system through lubricating nipples in the table plate.

Drive adaption/ Reference switch

Inductive switches

For more safeness it is recommended to install limit switches for linear modules driven by electric motors. Positions can be controlled or signals can be derivated by inductive switches. Switches are available in a set which consists of two switches, cams and fixing elements or as single switch.

Inductive proximity switch AXN(P) 45-Z

AXN 100-Z	-	110 x 85	4	AXN 100-Plate

Fastening and joining elements

Combinations with AXN or AXNP

More than only a single acting actuator ! Basic-Line modules are well thought-out, have high capacity and are a cost saving solution. Single actuators are also available as multi actuator systems. Upon customer's request, we can provide fastening shoulders, limit switches, coupling housing, planetary gear and drive connecting shaft as a completion to our AXN/AXNP modules.

Technical information

Actuator selection

Guide selection – roller guide LR or rail guide B

Application	horizontal	- LR or B
	vertical	- LR or B
Mass	low till medium*	- LR or B
	medium till high*	- B
Substantive		
Transverse moment loading		- B
Dynamic	low till medium*	- LR or B
	medium till high*	- B

Carriage size – single/twin carriage or long carriage

Mass

The mass to be moved should be well fastened on the carriage and not have large overhangs. The centre of gravity of the mass should be approximately in the middle of the carriage mounting surface. Alternatives for longer screw-on surfaces are long standard carriages or double carriages which can also be fitted with larger distances.

Overhanging or wide masses

If the mass to be moved is very wide or has an overhanging centre of gravity it is recommended to use two parallel actuator units (maybe driven by a connecting shaft).

* The specifications short, medium, long or low, medium, high are to be understood in the ratio 1/3, 2/3 and 3/3 of the technical performance data indicated in the catalogue for respective actuator types and sizes.

Technical information

Selection of linear actuator

Actuator size and type

The actuator size is mainly determined by the mass to be moved (weight and volume). This mass should be easy to mount and therefore should have a certain guide size and carriage mounting surface which also is decisive for the actuator size (see product overview in the catalogue).

The second selection criteria for the actuator is the moving dynamic of the mass. The resulting forces (e.g. driving forces, moments, centrifugal forces, etc.) must be absorbed by the toothed belt and by the guide. Based on the synoptical table in the catalogue possible actuator types and sizes can be specified.

To make the right choice the technical data indicated in the catalogue such as admissible loads and load moments should only be used by one third as the combination of forces and moments can significantly affect the lifetime.

Further selection criteria for the actuator type are space requirements and the travel length of the linear actuator. It may be recommendable to replace larger single actuators by smaller parallel actuators and vice-versa. In case of large effective strokes, it may be necessary to use large actuators also for small loads.

The above are only rough guidelines for the selection of an actuator which can also be completely different depending on the application and the existing realities or on the customers personal wishes. In case of combined actuators such as X-Y systems or X-Y-Z systems a gantry structure with two parallel basic actuators should always be given preference to a boom system with only one basic actuator. For the design of combined systems the actuator on which the mass to be moved will be mounted should always be viewed at first.

We shall be pleased to assist you with the design and selection of the right modules for your application.

Please send us information about your application and technical data.
(See also application form at the end of the catalogue)

Design fundamentals

General

All data refer to the respective standard type of the linear module. A special design or temperatures above 80°C can considerably affect these values.

Technical data, loads and load moments

The values indicated are maximum possible individual sizes. Combined loads (e.g. forces and moments from different directions) reduce these maximum values and can have a negative effect on precision. If linear actuators are not fully supported, in addition a deflection or torsion test may become necessary.

Repeat accuracy

The repeat accuracy defines that under the same conditions within the given tolerances the mechanical linear module will reach again a position already approached before.

Stroke length

The stroke length indicated in the order code corresponds to the maximum possible travel distance. Accelerating and stopping distances or a possible safety overflow must be taken into consideration for design.

Speeds

The theoretical travel speed results from the screw pitch or in case of a toothed belt actuator from the stroke per turn of the pinion, the gear ratio of a possible gear and a motor speed. To determine the actually possible travel speed the specific conditions, the mass to be moved, acceleration, motor output and the admissible drive torque of the selected actuator as well as the efficiency have to be considered.

Operating characteristics and production tolerances

Differences in running performance and noise development with identical units cannot be completely excluded, not even by our high production standard with small production tolerances. Our extruded profiles are manufactured according to DIN EN 12020-2. Especially with reference to straightness and torsion these fixed tolerances mostly are clearly underrun. The exact adjustment of the linear units and/or mounting to precisely machined surfaces increase the guiding accuracy. A possible deflection of partially supported actuators mainly depends on the inherent rigidity, the load, the self-supporting length and the rigidity of the adjacent construction.

Calculation basis

Forces due to a moving mass

$$F_x = m \cdot a$$

$$F_y = m \cdot a$$

$$F_z = m \cdot (g + a)$$

F = load (N)

m = mass (kg)

a = acceleration (m/sec²)

g = acceleration of gravity (9,81 m/sec²)

Additional moment loading with an eccentric centre of gravity or lever arm

$$M_x = F_y \cdot l_z \text{ or } F_z \cdot l_y$$

$$M_y = F_x \cdot l_z \text{ or } F_z \cdot l_x$$

$$M_z = F_x \cdot l_y \text{ or } F_y \cdot l_x$$

l_x, l_y, l_z = distance of force application point in direction x, y, z, indicated in m

In most applications there are force combinations. The resulting total forces always must be smaller than the respective admissible values.

Drive sizing (estimate)

$$M_A = M_{Last} + M_{Leer}$$

M_A = necessary drive torque (Nm)

M_{Last} = load torque (Nm)

M_{Leer} = idle torque (Nm) – see data sheets

$$M_{Last} = \frac{F_x \cdot p}{2 \cdot \pi \cdot 1000}$$

F_x = feed force (N)

p = stroke/revolution (mm) for toothed drive belt
screw pitch (mm) for screw drive

η = for ball screw approx. 0.9

For screw drive::

$$M_{Last} = \frac{F_x \cdot p}{2 \cdot \pi \cdot \eta \cdot 1000}$$

Feed force for horizontal operation

$$F_x = m \cdot g \cdot \mu + m \cdot a$$

μ = friction coefficient for rail guide 0.02
for roller guide 0.05

Feed force for vertical operation

$$F_x = m \cdot (g + a)$$

Admissible drive torques

The maximum acceleration also depends on the maximum admissible drive torque of the respective actuator. Example: calculation for toothed belt actuator AXN80-Z:

$$M_{Azul} = \text{belt traction} \times \text{pinion radius} = \frac{1450\text{N} \cdot 180\text{mm}}{2 \cdot \pi \cdot 1000} = 41.5\text{Nm}$$

Ordering code

Type designation for AXN and AXNP

Ordering example

AXN 65 - Z HW 14 - LR 35 - 1000 - 1340 - 00

Type designation

AXN...
AXNP...

Drive configuration

Z: belt drive
O: no drive

Drive configuration with belt drive

HW: hollow shaft
WL (WR): driveshaft left (right)
WD: driveshaft both sides
KL (KR): partially integrated coupling on one side left (right)
PL (PR): planetary gear left (right)
PLK (PRK): planetary gear left + coupling right
(planetary gear right + coupling left)
MKL (MKR): motor flange with coupling left (right)

Characteristic of the shaft / coupling with belt drive

- diameter of shaft or hollow shaft (HW, WL, WR, WD)
- diameter of coupling holes (KL, KR, MKL, MKR)
- gear ratio (PL, PR)
- for type PLK or PRK only the gear ratio is indicated

Options

This number will be given by Nadella. It shows special marks or special design which are noted in clear text.

- 00 without options
 - 10 cover band
 - 12 slot covers
 - 13 cover band
 - 22 twin carriage
 - 23 long carriage
 - 35 with caged ball technology
 - 77 stainless version (NX)
 - 88 profile with junction
 - 99 according to drawing
- more than one option possible

Overall length

(Stroke + length surcharge according to data given in this catalogue)
