<b>Handling Precautions</b> .....	<b>18</b>

Recent advances in the process technologies employed in semiconductor fabrication and other industrial sectors have raised expectations for the bearings used in vacuum environments. Today, such bearings are required to be cleaner, more durable and more resistant to corrosion. In response, NTN Corporation has developed a bearing technology that employs solid lubricant for ultra-high vacuum environments.

Moreover, NTN has continued to expand its product line with bearings designed for corrosive environments. These innovations round out a product line that already features vacuum bearings and ultra-clean bearings designed to accommodate today's increasingly complex production environments.

## 1. Selecting Bearings for Extreme Environments

The operating environments of today's advanced industries — as typified by the semiconductor fabrication industry — are complex and entail a variety of factors. To simplify the selection of the optimal bearings for complex environments, please refer to **Figure 1**. It illustrates schematically three such environments — vacuum, clean and corrosive — as well as the complex interrelation among these environments. This diagram lists the typical equipment and facilities found in each environment as well as the applicable bearings.

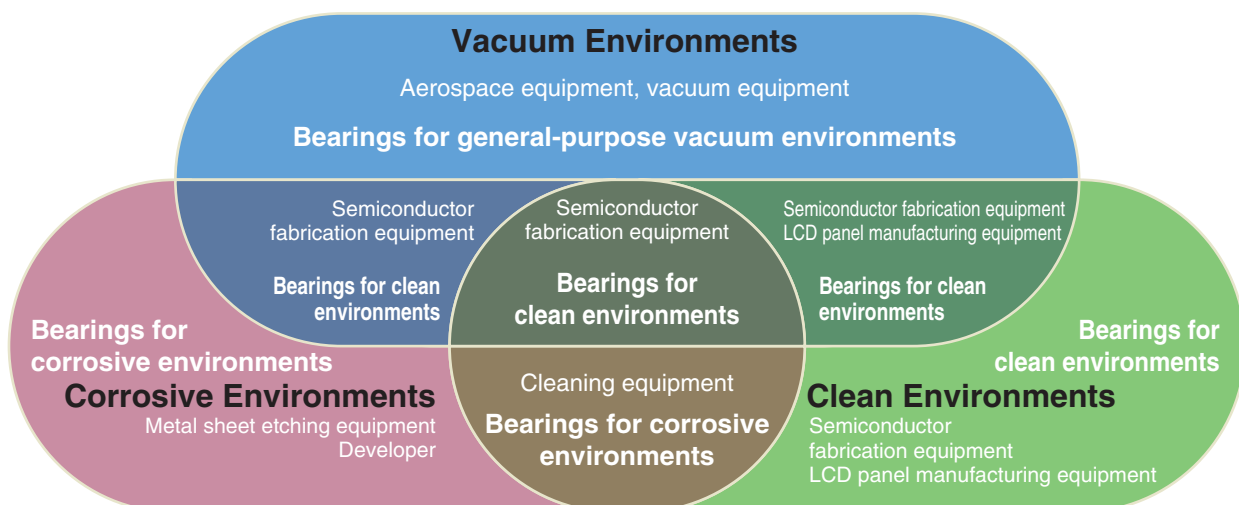

Fig. 1

## 2. Classifications and Standard Specifications of Bearings for Special Environments

**Table 1** summarizes the standard specifications of bearings for special environments.  
For custom specifications, please contact NTN Engineering.

**Table 1. Bearings for Special Environments: Classifications and Standard Specifications**

Classification	Operating Environment					Bearing Specification	
	Temperature	Atmosphere	Vacuum	Corrosives	Magnetic field	Inner Ring/Outer Ring	Ball
Vacuum environments	~150°C	○	○			Martensite stainless steel + MoS <sub>2</sub> coating	Martensite stainless steel + MoS <sub>2</sub> coating
	~300°C		○			Martensite stainless steel + Pb coating	Martensite stainless steel + Pb coating
	~400°C		○			Martensite stainless steel	Martensite stainless steel + Ag coating
Clean environments	~ 70°C	○				Martensite stainless steel	Martensite stainless steel
	~200°C	○	○				
	~260°C	○	○			Martensite stainless steel + special PTFE coating	Martensite stainless steel + special PTFE coating
	~300°C	○	○				Martensite stainless steel + special PTFE coating + special balls
Contaminant-free environments	~ 80°C	○				Bearing steel or martensite stainless steel	Bearing steel or martensite stainless steel
	~100°C	○					
	~120°C	○					
Corrosive environments	~120°C	○		○		Bearing steel + corrosion resistant coating	Bearing steel
		○		○		Martensite stainless steel	Martensite stainless steel
	~150°C	○	○	○	○	Ceramic	Ceramic

### 3. Performance and Technical Data of Various Bearings

#### 3.1 Vacuum bearings

Table 2 Performance of Vacuum Bearings

◎ : Excellent ○ : Good △ : Fair × : Not recommended

Bearing type	Allowable vacuum range Pa	Allowable temperature range °C	Load-carrying capacity	Low-torque performance	Out Particle	Outgassing	Electrical conductivity
MoS <sub>2</sub> -coated bearings	10 <sup>-5</sup> ~1	~ +150	△	◎	○	○	×
Pb-coated bearings	~10 <sup>-5</sup>	~ +300	○	◎	○	◎	○
Ag-coated bearings	~10 <sup>-5</sup>	~ +400	△	○	○	◎	○
Bearings with vacuum grease (optional)	10 <sup>-5</sup> (vapor pressure) to atmospheric	~ +200	◎	×	×	×	×

Note: Ratings represent relative performance among vacuum bearings.

#### Test Data

Results of durability evaluation.

Figures 2 through 6 provide sample evaluations of coating-dependent durability.

Fig. 2 Durability tester for high-vacuum bearing

● Test conditions

- Bearing : Deep groove ball bearings, φ8×φ22×7 (Open type)
- Axial load : 10N, 30N, 50N
- Speed : 2 500min<sup>-1</sup>
- Degree of vacuum : Around 10<sup>-5</sup> Pa
- Temperature : Room temperature
- Evaluation criterion : Bearing life is regarded as having expired when the bearing friction torque with two bearings reaches 10<sup>-2</sup> N · m.

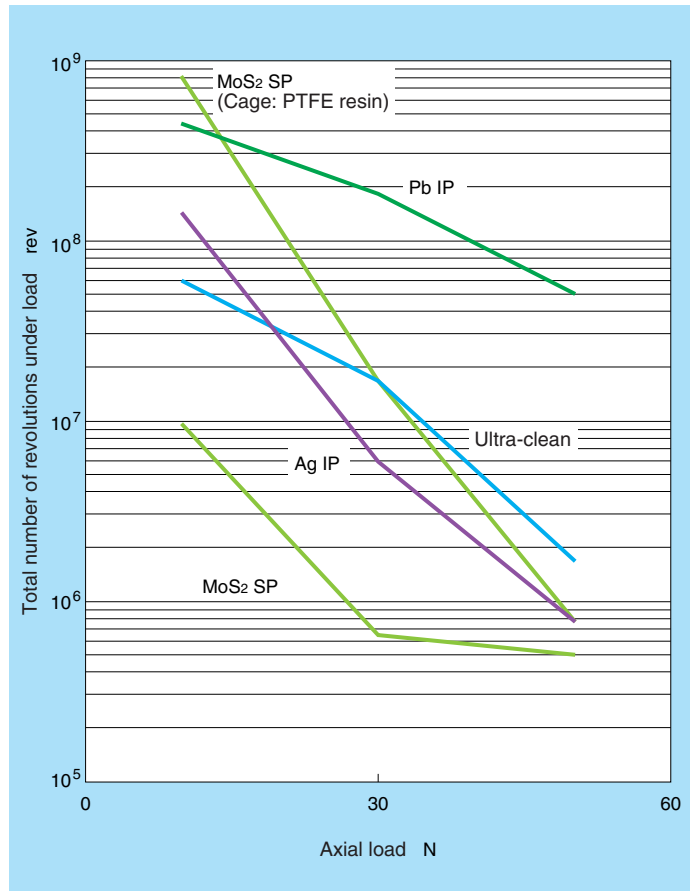

Fig. 3 Load vs. durability in a vacuum

● Test conditions

Bearing : Angular contact ball bearings,  $\phi 10 \times \phi 22 \times 7$   
 (Full complement type)  
 Axial load : 10N  
 Speed :  $2\,500\text{min}^{-1}$   
 Degree of vacuum : Around  $10^{-5}$  Pa  
 Temperature : Room temperature

Fig. 4 Evaluation of durability of Ag IP bearing

● Test conditions

Bearing : Angular contact ball bearings,  $\phi 10 \times \phi 22 \times 7$   
 (Cage: Lead copper alloy)  
 Axial load : 10N  
 Speed :  $7\,500\text{min}^{-1}$   
 Degree of vacuum : Around  $10^{-5}$  Pa  
 Temperature : Room temperature

Fig. 5 Evaluation of durability of Pb IP bearing

● Test conditions

Bearing : Angular contact ball bearings,  $\phi 10 \times \phi 22 \times 7$   
 (Cage: PTFE resin)  
 Axial load : 10N  
 Speed :  $7\,500\text{min}^{-1}$   
 Degree of vacuum : Around  $10^{-5}$  Pa  
 Temperature : Room temperature

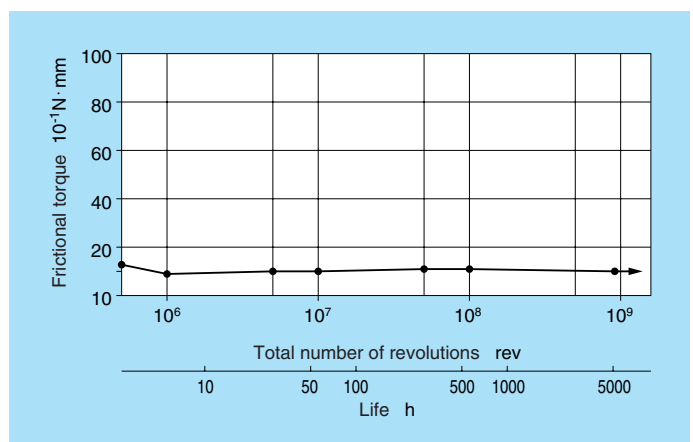

Fig. 6 Evaluation of durability of MoS<sub>2</sub> SP bearing

### 3.2 Bearings for clean environments

**Table 3 Performance of Bearings for Clean Environments**

◎ : Excellent   ○ : Good   △ : Fair   × : Not recommended

Bearing type	Allowable vacuum range Pa	Allowable temperature range °C	Load-carrying capacity	Low-torque performance	Out Particle	Outgassing	Corrosion resistance	Maximum $d_n$ value
Bearings with low out particle grease	Atmospheric	+ 70	◎	△	△	—1)	△	$20 \times 10^4$
Bearings with low out particle grease for vacuum environment	$10^{-5}$ to atmospheric	$\sim +200$	◎	×	△	△	△	$20 \times 10^4$
Ultra-clean bearings	$10^{-5}$ to atmospheric	$\sim +260$	△	◎	◎	◎	△	$1 \times 10^4$
Long life ultra-clean bearings	$10^{-6}$ to atmospheric	$\sim +300$	△	◎	○	◎	△	$1 \times 10^4$

Note: Ratings represent relative performance among bearings designed for clean environments.

1) Excluded from evaluation because this type of bearing is used under atmospheric pressure.

### Test Data

#### 3.2.1 Evaluation of out particle characteristics

Figures 7 through 13 provide evaluations of the tendency to out particles.

● Test conditions

Bearing : Deep groove ball bearings  
 $\phi 8 \times \phi 22 \times 7$   
 Axial load : 10N  
 Speed :  $50 \text{ min}^{-1}$   
 Minimum particle size measured :  $0.3 \mu\text{m}$   
 Temperature : Room temperature

● Test results

- Generation of airborne particles is indicated as the number of particles present in one cubic foot of collected air (number of particles/cf).
- NTN's ultra-clean bearings generate a very low particle count (equivalent to Class 10).

**Fig. 7 Measurement of out particle by ultra-clean bearing (at atmospheric pressure)**

● Test conditions

Bearing : Deep groove ball bearings  
 $\phi 8 \times \phi 22 \times 7$   
 Axial load : 10N (50N)  
 Speed :  $50 \text{ min}^{-1}$   
 Degree of vacuum : Around  $10^{-5}$  Pa  
 Minimum particle size measured :  $0.38 \mu\text{m}$   
 Temperature : Room temperature ( $20^\circ\text{C}$ )

● Test results

- The out particle characteristics of ultra-clean bearings are not significantly altered by load or temperature. This type of bearing exhibits low out particle over a wider range of conditions.

**Fig. 8 Measurement of out particle by ultra-clean bearing (in vacuum)**

● Test conditions

Bearing : Deep groove ball bearings  $\phi 8 \times \phi 22 \times 7$   
 Axial load : 10N  
 Speed : 50min<sup>-1</sup>  
 Minimum particle size measured : 0.38  $\mu\text{m}$   
 Degree of vacuum : Around 10<sup>-5</sup> Pa

Fig. 9 Measurement of out particle by ultra-clean bearing (in vacuum)

● Test conditions

Bearing : Deep groove ball bearings  $\phi 8 \times \phi 22 \times 7$   
 Axial load : 10N  
 Minimum particle size measured : 0.1  $\mu\text{m}$   
 Temperature : Room temperature

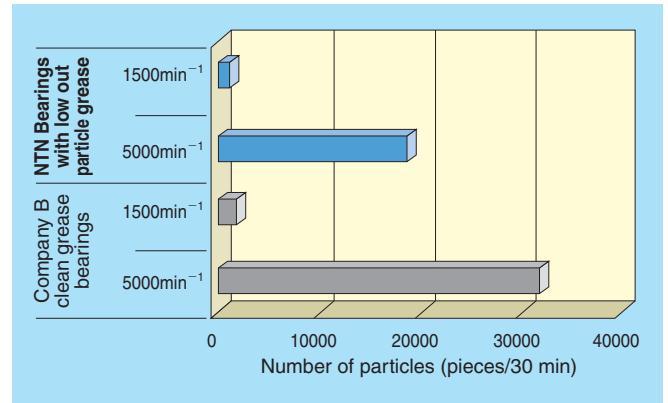

Fig. 10 Measurement of out particles by bearing with low out particle grease (at atmospheric pressure)

Fig. 11 Measurement of out particles by bearing prelubricated with low out particle vacuum grease (in vacuum)

● Test conditions

Bearing : Deep groove ball bearings  $\phi 8 \times \phi 22 \times 7$   
 Axial load : 30N  
 Speed : 200min<sup>-1</sup>  
 Minimum particle size measured : 0.2  $\mu\text{m}$   
 Degree of vacuum : Around 10<sup>-5</sup> Pa

● Test conditions

Bearing : Deep groove ball bearings  $\phi 10 \times \phi 26 \times 8$   
 Axial load : 15N  
 Minimum particle size generated : 0.1  $\mu\text{m}$   
 Temperature : Room temperature (at atmospheric pressure)

Fig. 12 Relation between bearing speed and number of out particles (bearing with low out particle grease)

● Test conditions

Bearing : Deep groove ball bearings  $\phi 10 \times \phi 26 \times 8$   
 Speed : 400min<sup>-1</sup>  
 Minimum particle size generated : 0.1  $\mu\text{m}$   
 Temperature : Room temperature (at atmospheric pressure)

Fig. 13 Relation between axial load and number of out particles (bearing with low out particle grease)

### 3.2.2 Results of durability evaluation

Figures 14 through 16 provide evaluations of bearing durability.

● Test conditions

Bearing : Deep groove ball bearings  $\phi 8 \times \phi 22 \times 7$   
 Axial load : 10N  
 Speed : 360min<sup>-1</sup>  
 Degree of vacuum : Around 10<sup>-5</sup> Pa  
 Temperature : Room temperature

Fig. 14 Evaluation of durability of ultra-clean bearing

● Test conditions

Bearing : Deep groove ball bearings  $\phi 20 \times \phi 47 \times 14$   
 Axial load : 67N  
 Radial load : 67N  
 Speed : 10000min<sup>-1</sup>  
 Temperature : 100°C

Fig. 16 Evaluation of durability of bearing with low out particle grease

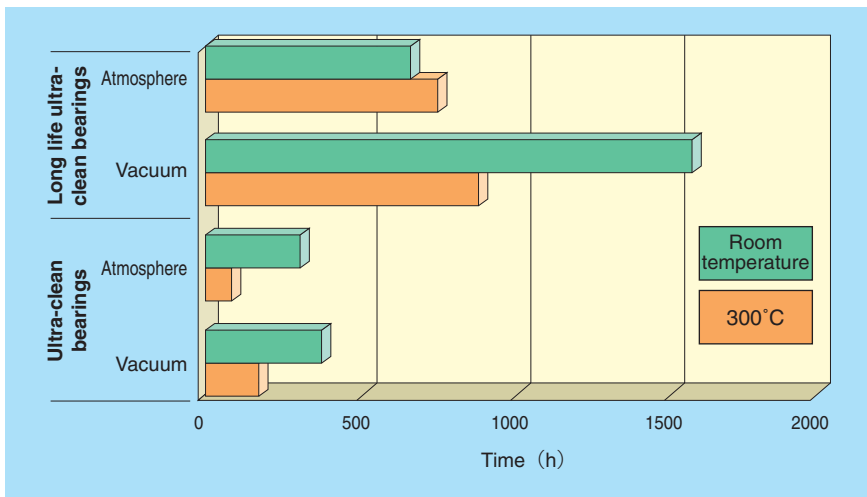

Fig. 15 Evaluation of durability of long-life ultra-clean bearing

● Test conditions

Bearing : Deep groove ball bearings  $\phi 8 \times \phi 22 \times 7$   
 Axial load : 10N  
 Speed : 2500min<sup>-1</sup>  
 Atmospheric pressure/vacuum (around 10<sup>-5</sup> Pa)

### 3.2.3 Evaluations of outgassing characteristics

Figures 17 and 18 provide evaluations of outgassing characteristics.

● Test conditions

- Bearing : Ultra-clean bearing 6 mm dia.×19 mm dia.×6
- : Bearing with vacuum grease 6 mm dia.×19 mm dia.×6
- : Untreated bearing (PTFE cage) 9.5 mm dia.×22 mm dia.×7.1
- Degree of vacuum : Around  $10^{-5}$  Pa
- Temperature : Room temperature, 200°C

Fig. 17 Example of gasses released immediately after installation of bearing (at room temperature)

- Components that increased after bearing installation are indicated in red, relative to the background measurement of the test equipment.
- The diagram shows that H<sub>2</sub>O, N<sub>2</sub> (CO), O<sub>2</sub> and the like are present as background components.
- The ultra-clean bearing exhibited some increase in N<sub>2</sub> (CO) outgassing, but did not show increased outgassing of other components. Additionally, while running, it did not exhibit any increase in outgassing. The NTN ultra-clean bearing always exhibits low outgassing.

Fig. 18 Comparison of outgassing at room temperature and high temperature

- Components that increased as a result of the temperature increase from room temperature to 200°C are indicated in red.
- At 200°C, the amount of gasses released by the ultra-clean bearing somewhat exceeded the amount released at room temperature. However, the amount remained small, indicating the low outgassing characteristic of the ultra-clean bearing even in high-temperature applications.

### 3.3 Bearings for corrosive environments

**Table 4 Performance of Bearings for Corrosive Environments**

	Applicable temperature range °C	Load-carrying capability
PPS resin rolling bearing	Room temperature to 150°C	Yes

**Table 5 Corrosion resistance of bearings for corrosive environments**

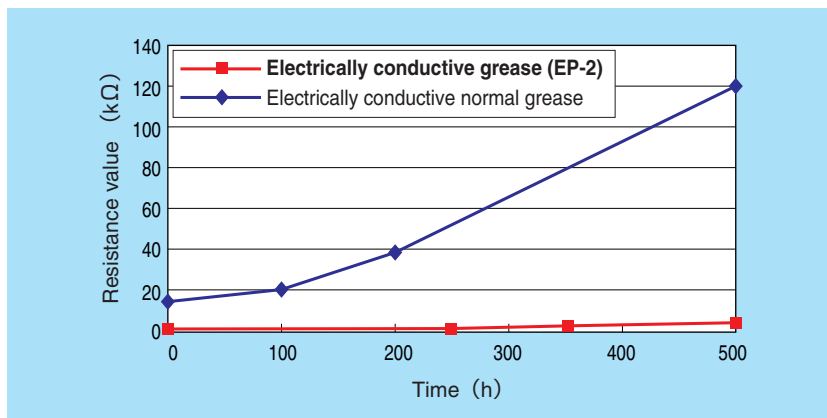

○ : Good    △ : Fair    × : Not recommended

	Inner ring & outer ring		Cage		Rolling elements	
	PPS resin	Polyimide resin (optional)	Polyamide resin (optional)	PTFE resin	Ceramic	Glass
10% hydrochloric acid	○	○	×	○	○	△
35% sulfuric acid	○	○	×	○	○	○
35% nitric acid	○	○	×	○	○	○
10% acetic acid	○	△	×	○	○	○
10% potassium hydroxide	○	△	○	○	○	×
10% sodium hydroxide	○	△	○	○	○	×
30% aqueous ammonia	○	△	×	○	○	○

### 3.4 Electrically conductive bearings

● Test conditions

Bearing : Deep groove ball bearings  $\phi 30 \times \phi 42 \times 7$     Speed : 50N  
 Speed : 150min<sup>-1</sup>    Temperature : Room temperature

**Fig. 19 Durability with electrically conductive grease (EP-2)**

## 4. Material Characteristics

**Table 6 Comparison of Characteristics of Ceramic (Si<sub>3</sub>N<sub>4</sub>) and Bearing Steel (SUJ2)**

Characteristics		Ceramic (Si <sub>3</sub> N <sub>4</sub> )	Bearing Steel (SUJ2)
Hardness	HV	1500	750
Density	g/cm <sup>3</sup>	3.2	7.8
Young's modulus	GPa	310	210
Poisson's ratio		0.26	0.3
Coefficient of thermal expansion	× 10 <sup>-6</sup> /°C	3.0	12.5
Thermal conductivity	W/m·k	29	46
Magnetism		Non-magnetic	Ferromagnetic
Corrosion resistance		Good	Poor
Electrical conductivity		Insulator	Conductor

## 5. Applications

Table 7 summarizes typical applications of NTN bearings designed for extreme environments.

Table 7 Typical Applications of Bearings for Extreme Environments

Equipment	Machine/Device	Application	For Vacuum Environments				For Clean Environments				For Corrosive Environments
			Vacuum grease	Ag coating	Pb coating	MoS <sub>2</sub> coating	Ultra-clean	Long-life ultra-clean	Low out particle grease	Low out particle vacuum grease	PPS resin
Aerospace	Manipulators	Actuators	○			○					
	Geosynchronous satellites	Control mechanisms				○					
	Artificial satellites	Antenna deployment mechanisms				○

1) Minimum allowable chamfer dimension  $r$ .

2) Seal grooves may be provided in some cases.

## 6.2 Ultra-clean bearings

Open type <sup>2)</sup>

Shielded type

- 1) Minimum allowable chamfer dimension  $r$ .
- 2) Seal grooves may be provided in some cases.
- 3) Allowable radial load is the maximum allowable load with only a radial load applied.
- 4) Maximum allowable temperature is 120°C (260°C for others).
- 5) The basic dynamic load rating is the value for stainless steel bearings.

The lead time for products in this table is two weeks.

Note: NTN continue to expand our product line.  
For information on bearings not included in this table, contact NTN Engineering.

1) Minimum allowable chamfer dimension.

2) Allowable radial load is the maximum allowable load with only a radial load applied.

3) The basic dynamic load rating is the value for stainless steel bearings.

4) Maximum allowable temperature is 300°C.

**The lead time for products in this table is two weeks.**

Note: NTN continue to expand our product line. For information on bearings not included in this table, contact NTN Engineering.

1) Minimum allowable chamfer dimension.

2) Maximum allowable temperature is 120°C (200°C for others).

3) The basic dynamic load rating is the value for stainless steel bearings.

**The lead time for products in this table is two weeks.**

Note: NTN continue to expand our product line. For information on bearings not included in this table, contact NTN Engineering.

## Handling Precautions

- (1) Bearing components have been thoroughly degreased. Do not touch any bearing component with bare hands. Doing so may cause rusting of the bearing. Always wear clean, lint-free gloves when installing a bearing.**
- (2) Do not rinse a bearing with an organic solvent. Doing so may lead to lubricant leakage or damage to the lubricant film.**
- (3) Do not unpack a vacuum-packed or heat-packed bearing until immediately before installation. Otherwise, the bearing may rust or become contaminated with dust. If the bearing will not be used for an extended period, store it in a dry, closed container such as a desiccator.**
