

FALK™ DRIVE ONE® | ONE DRIVE FOR ONE WORLD  
English-Inch

**now more competitive than ever ...**

## ONE RELIABLE DRIVE

For more than 100 years, the Falk™ name has earned a reputation for delivering the highest value gear drive solutions in the power transmission industry.

The Falk™ Drive One® product family of gear drives carries on this tradition. Its robust yet elegant design integrates the proven features and benefits of past designs with industry-leading

innovations derived from our experience with heavy industry's most demanding applications.

The result is a new standard in drive reliability... and a drive with the design and feature sets that make it easy for you to standardize on one platform for all your mid-to-large-size drive requirements.

### Falk™ Drive One® – Universal Series (Sizes 1130 – 1210)

Large inspection cover provides easy access for maintenance

6-sided mounting capability allows mounting in any position

Precision-ground carburized high strength gearing assures long life and quiet operation

Jacking bolt holes simplify installation and alignment

Easy-adjust tapered roller bearings offer longer life and simplified maintenance

Dipstick with filtered breather allows easy lube checks, helping extend oil/drive life. Falk™ AirMax® optional

Internal oil distribution system contributes to long bearing life and cooler running drives

Tandem lip seals with grease-purged cavity (Viton® high speed) on all shaft extensions help prevent leaks

# ... with 18% higher ratings

## Falk™ Drive One® – Conveyor Series (Sizes 1220 – 1250)

In addition to the quality features found on all Falk™ Drive One® units, our Conveyor Series includes unique features to optimize performance and reliability for high capacity belt conveyors, and other critical equipment applications.

Right or left hand mounting means one spare accommodates both configurations

Split housing design facilitates assembly/disassembly and inspection

Housing surface area, a proprietary elevated oil distribution pan and reduced oil sump allow most applications to be cooled with shaft driven fans

Large shaft extensions offer simplified installation of shaft couplings and drive accessories

Falk™ AirMax® breather and sealed dipstick prevent water and contaminant ingress

Patented internal oil distribution system helps keep vital components properly lubricated and ensures lasting performance

All bearings sized for 60,000 L10 life @ a 1.5 Service Factor

Falk™ Magnum® “No Leak” drain back seals w/grease-purged cavity are standard on all shaft extensions

Rugged ductile iron housing stands up to high impact and shock service

## Falk™ Drive One® – High Torque Series (Sizes 1160 – 1210)

Designed for use anywhere slow speed and high torque is required.

A large range of standard ratios from 160:1 to 710:1 and made-to-order ratios of 1000:1 and higher ensure a cost competitive drive for all slow speed applications

tandem lip seals with grease purge cavity (Viton® high speed) on all shaft extensions prevent leaks

Higher efficiency than low speed / high torque hydraulic motors save on energy costs year after year

Standard accessories such as torque arms, shrink discs, backstops and motor interfaces provide for packaged solutions, from electrical source to driven equipment

Stock components reduce lead time

Compact size reduces space requirements

---

## ONE COMPLETE SOLUTION

Falk™ Drive One® is designed to be the most reliable drive available for mid-to-large-sized drive requirements. It's also designed to set a new standard for responsiveness to customer needs for comprehensive, cost-effective power transmission solutions.

- Fewer parts than traditional designs mean even greater reliability and a highly competitive initial cost
- Parts standardization across sizes means quicker turn times and up to a 75% reduction in parts inventories
- Pre-packaged complete drive solutions minimize installation time and costs
- A wide range of sizes and 6-sided mounting flexibility make this solution easy to standardize on... no matter where heavy industry takes you around the world

### Standardized Drives

#### Motorized:

Standard brackets, motor adapters and motor mounts accept NEMA and IEC motor frames.

#### Low Ratio:

High thermal and high capacity drives are ideal for pump and paper machine applications.

#### High Ratio:

Compound drives with an Falk™ Ultramite® gearmotor primary enables unlimited ratio availability.

#### Mixer:

Parallel and Right Angle vertical drives offer drywell assembly and positive lubrication of upper bearings.

### Shaft Mounted Conveyor Drives

#### Alignment-Free:

Eliminates motor and driven equipment alignment. Rugged motor flange accommodates standard TD and IEC flanged motors, with fluid or standard couplings.

#### Swing Base:

Most flexible design; handles widest assortment of motor/coupling combinations.

#### Bucket Elevator:

Inching drive package designed for low maintenance, long life and safety.

#### V-Belt:

Top mounted motor with a v-belt connection delivers a compact/cost efficient solution.

### High Torque Planetary Drives

Planetary final stage provides a compact, cost-effective alternative to hydraulic and conventional low rpm drives.

## ONE QUICK DRIVE

In an increasingly competitive global marketplace, we strive to help you succeed by providing the best overall customer experience through our innovative products and services, exceptional people and speed in everything we do.

### Quick Ship

- Falk™ Drive One® design streamlines the manufacturing process
- Our worldwide network of strategically located Rexnord® Build Centers assures rapid availability on a global basis
- Centralized Build Center utilizes state-of-the-art flow manufacturing techniques for reduced lead times throughout North America
- Many sizes, types, and ratios can be shipped in 1–5 days

### Quick Select

Our commitment to speed includes the Quick Selection Guide, which makes it fast and easy to choose the right Falk Drive One model for your job.

- Simply look up the application, horsepower and speed
- Options enable you to select the turnkey solution that best fits your requirements, including motors, drives, fans – virtually everything you need is in one complete, convenient package, identified by one part number

### Quick Repair/Exchange

- A comprehensive range of solutions designed to meet your cost and lead time requirements
- Falk Drive One Repair Kits provide all the bearings, seals, hardware and instructions to do a partial drive rebuild at your facility

### Quick Change

- Falk™ Drive One® allows you to easily replace any type and brand of large drive
- Conveniently upgrade any drive to the lowest total cost leader
- At the same time, standardize on a single drive platform to maximize your savings over time

### Benefits:

- Improve performance and operating life
- Cost savings – up to 65% over obsolete equipment
- Better unit and parts availability
- Easy “drop-in” replacement
- 3-year “heavy-duty” warranty

### The alternative to:

- Expensive, obsolete drives
- Hard-to-get imported components
- Problem applications

Falk Drive One – redefining lowest total cost throughout North America and around the world.

### One Worry-Free Solution

- Full 3-Year Warranty – standard – on every Falk Drive One

### Know-How & Customer Service

#### People:

- 24/7 support
- Field service
- Problem solving support

#### Information:

- Detailed selection guides
- Service/parts literature
- Complete online reference material

### Distributor+... Added Value

- Project coordination
- Installation assistance
- Field support
- Spares planning
- Customer in-plant knowledge

Conversion Factors	210

### HEAVY DUTY WARRANTY

**Factory Warranty** We're so confident in the performance and reliability of our latest generation of Falk gear drives that we're backing this comprehensive offering with the best standard warranty in the business. Our full, 3-year Heavy-Duty Warranty provides "shaft-to-shaft" protection on all Falk components – including bearings and seals (warranty extends for 3 years from date of shipment). It's an industry first... and one more powerful reason why Rexnord is your ultimate bottom-line value.

## Basic Information

### Safety Notes

**Falk Gear Drives** The Falk and Rexnord name on the gear drive is the purchaser's assurance that the drive was engineered, rated and manufactured to sound design practices.

The power supplied to the geared drive must be equal to or less than the power for which the drive was selected using the appropriate mechanical service factor for the application. The customer must assume the responsibility of isolating the gear drive from any vibratory or transient load induced by the driven equipment.

Install and operate Rexnord products in conformance with applicable local and national safety codes and per Rexnord installation manuals which are shipped with gear drives and are also available upon request. Suitable guards for rotating members may be purchased from Rexnord as optional accessories. Contact your local Rexnord district office for complete details.

**People Conveying Equipment** Selection of Rexnord gear drives for applications whose primary purpose is the transportation of people is not approved. This includes such applications as freight or passenger elevators, escalators, man lift platforms and ski tows and ski lifts.

If the primary purpose of the application is material conveyance and occasionally people are transported, the Rexnord warranty may remain in effect provided the design load conditions are not exceeded and certification to the appropriate safety codes and load conditions has been obtained by the system designer or end user from the appropriate enforcement authorities.

**Gear Drive Mechanical Power Ratings** Gear drive mechanical power ratings stated in this selection guide allow 100% overload for starting loads and momentary overloads associated with normal electric motor driven standard applications operating 10 hours per day under uniform conditions, applications where the recommended mechanical service factor per Page 11 or 12 of this selection guide is 1.00, and where the actual mechanical service factor of the gear drive versus full motor rated power is equal to or greater than 1.00.

For other **standard** applications not meeting conditions stated in the previous paragraph, determine the appropriate mechanical service factor from Page 11 or 12, then calculate an equivalent power by multiplying the actual power transmitted by the previously determined mechanical service factor. For these applications, the mechanical power rating of the gear drive selected must equal or exceed the equivalent power that has been calculated.

**For non-standard** applications, those where excessive overloads, reversing service, mechanical brakes, or oversize prime movers are present, refer to Page 10, Conditions Affecting Selection, for special instructions.

**Gear Drive Basic Thermal Ratings** Gear drive basic thermal ratings stated in this selection guide are based on the following assumed conditions:

Ambient temperature is 77°F (25°C).

Altitude is between sea level and 2460 feet.

Ambient air velocity is between 1.6 fps and 4.6 fps typical of a large indoor room.

Duty cycle is continuous.

Orientation is floor mounted with shafts in same horizontal plane.

Thermal Factors & Procedures, Page 14, permit the calculation of an application adjusted thermal rating for the gear drive when local thermal conditions are different than those stated above. It is not necessary to apply the mechanical service factor to the basic thermal rating when determining the thermal adequacy of a gear drive.

**Interpolation of Gear Drive Mechanical Power Ratings and Torque Ratings** When the high speed shaft rpm for an actual application falls between two tabulated high speed shaft rpm's found in the selection tables, interpolate to determine gear drive rating.

**Stored and Inactive Drives** Each gear drive is spin-tested with a rust preventive oil that will protect parts against rust for a period of 4 months in an outdoor shelter or 12 months in a dry building after shipment from the Factory.

Periodically inspect stored or inactive drives and spray internal parts with rust inhibitor every six months or more often, if necessary. Drain oil before adding rust inhibitor. Indoor dry storage is recommended.

Drives ordered for extended storage can be treated at the Factory with a special preservative and sealed to rust-proof parts for periods longer than those cited above, if specified on the order.

Refer to Service Manual 128-014 for preparation of stored and inactive gear drives.

# Conditions Affecting Selection

## Non-Standard Selection Procedures

Some applications require special procedures, or are refer to Factory.

**Excessive Overloads** The maximum momentary or starting load applied to the gear drive must not exceed 200% of the rated load capacity of the gear drive (100% overload). Rated load capacity of the gear drive is defined as the power rating published in this selection guide with a mechanical service factor of 1.00. If the actual maximum momentary or starting load exceeds the conditions stated above, calculate an equivalent input power associated with the excessive overload by dividing the maximum overload by two. The gear drive selected must have a rated load capacity equal to or greater than the equivalent input power.

**Frequency of Starts** Starting frequency is an important consideration when selecting a gear drive. Applications involving 2 to 3 equally spaced starts per hour must utilize a minimum 1.5 service factor for unloaded starts, and a minimum 1.75 service factor for fully loaded starts. For applications involving more than 3 starts per hour, refer to Factory the application specifics such as starting frequency and maximum starting torque. AC motors also have similar limitations. The addition of a fluid coupling as a soft start device would increase the number of allowable starts.

**Reversing Service** Applications involving either more than 20 reversals per 10 hour period, or less than 20 reversals per 10 hour period with peak torques greater than 200% of normal load must be referred to Factory.

**Brake Equipped Applications** When a gear drive is equipped with a “working” brake that is used to decelerate the motion of the system and the brake is located between the prime mover and the gear drive, select the gear drive based on the brake rating or the highest equivalent input power, whichever is greater. If the brake is used for holding only and is applied after the motion of the system has come to rest, the brake rating must be less than 200% of the rated load capacity of the gear drive selected for the application. If the brake rating is greater than 200% of the rated load capacity, refer the application to the Factory. Also refer to the Factory all applications in which the brake is located at the output shaft of the gear drive.

**Oversize Prime Movers** Recommended Mechanical Service Factors do not cover applications that require oversize prime movers for high energy or peak loads. Refer such applications to the Factory for selection of suitable gear drives.

**Speed Variation or Multi-Speed Applications** — The gear drives offered in this selection guide are designed to operate with splash lubrication on any single speed application and any ratio shown in the selection guide unless otherwise noted. It is essential that all orders indicate the operating speed requirements and ratio so that the proper internal oil distribution accessories can be supplied for the specific speed.

Falk gear drives use different oil levels for various gear drive sizes, speeds and ratios. Consequently, to operate an existing gear drive at different speeds from those shown on the nameplate, full application and nameplate information must be referred to the Factory for review of the lubrication system.

All variable or multi-speed applications will be referred to the Engineering Department to specify lubrication components for adequate lubrication at the slowest speed, without excessive temperature or churning at the highest speed. It is essential that all orders indicate minimum and maximum speeds, as well as the speed duration cycles. A separate motor-driven oil pump (at an extra charge) may be required.

When selecting gear drives for multi-speed or variable speed applications, determine the speed at which the greatest torque is developed and select the gear drive on this basis. If the speed is not listed in the selection table, interpolate to determine the gear drive rating.

**Application Adjusted Thermal Rating, Page 14**, The Application Adjusted Thermal Rating is the actual power that a gear drive will transmit continually for 3 hours or more without overheating. Although it is not necessary to apply the mechanical service factor when determining thermal adequacy of a gear drive, the Application Adjusted thermal Rating considers thermal factors associated with the application that will affect the ability of the gear drive to dissipate thermal energy. These thermal factors include ambient temperature, altitude above sea level, ambient air velocity, inlet water temperature (when cooling tubes are offered), gear drive orientation and duty cycle. Thermal factors on Page 14 are used to adjust the Basic Thermal Rating when determining the Application Adjusted Thermal Rating.

A check of the application adjusted thermal rating versus the actual power transmitted is necessary for the following applications:

- Continuous duty application where the gear drive runs continuously without shutdown for 3 hours or more per day.
- Intermittent duty applications where the gear drive operates for 3 hours or more per day, and run time intervals exceed the duration of the immediately following shutdown intervals. If any run time interval equals or exceeds 3 hours, the application is considered continuous duty.

The duty cycle factor permits an upward adjustment of the basic thermal rating associated with intermittent duty applications above, and takes into account simply the % operating time per hour of the gear drive, regardless of duration relationship between run time intervals and down time intervals, and provided no specific run time interval exceeds one hour in duration.

Other short interval intermittent duty applications, not meeting criteria stated above, may generate only modest thermal energy to be dissipated by the gear drive. Refer full application details to the Factory for selection of the minimum cooling method that is adequate.

**Effects of Solar Energy** If a drive operates in the sun at ambient temperatures over 100°F (38°C), then special measures must be taken to protect the drive from solar energy. This protection can consist of a canopy over the gear drive or reflective paint on the gear drive. If neither is possible, a heat exchanger or other cooling device may be required.

**Overhung Loads and Thrust Loads** Overhung loads and thrust loads must be taken into account when selecting a gear drive. If either an overhung load or thrust load is imposed on the gear drive, or if both an overhung load and thrust load are applied simultaneously, refer application details to the Factory for correct gear drive selection.

**Product Modifications** The Factory can supply special product modifications to suit your application needs. Contact your local Representative for housing modifications, special ratios, special shafts, special mounting orientations, accessory modifications and other special application requirements.

**Seal Housing Grease** All gear drives will be shipped with Falk LTG grease in the seal housing cavities. Where this grease could contaminate products produced by customer processes, such as in the food and drug industries, clearly indicate on your purchase order that, “Gear drive seal housing cavities must not contain grease.”

**Oil Pump Equipped Application** When a gear drive is equipped with an external motor driven oil pump, and the ambient temperature falls below 50°F (10°C), or the oil viscosity is in excess of 8000 SSU, an oil heater may be required to maintain a satisfactory flow rate at startup to prevent bearing failure. Consult the Factory.

**Backstop-Equipped Drives** Drives with integral backstops require minimum service factors as shown in Table 1A, Page 11. Select drive to the recommended Service Factor in Table 1A, Table 2 or 3, whichever is greater.

**Table 1 Mechanical Service Factor conversions**

Table 2 or 3 3 to 10 hour Service Factor	3 to 10 Hours per Day	Over 10 Hours per Day	Intermittent—Up to 3 Hours per Day †	
	Multi-Cyl. Engine †	Multi-Cyl. Engine †	Motor	Multi-Cyl. Engine ‡
1.25	1.25	1.50	1.25	1.25
1.25	1.50	1.75	1.25	1.25
1.50	1.75	2.00	1.25	1.50
1.75	2.00	2.25	1.50	1.75
2.00	2.25	2.50	1.75	2.00

† For applications operating one half hour or less per day and applications driven by single cylinder engines, refer to the Factory.  
‡ These service factors are based on the assumption that the system is free from serious critical and torsional vibrations and that maximum momentary or starting loads do not exceed 200% of the normal load.

**Table 1A — Backstop Minimum Service Factor**

DRIVE SIZE	Minimum Service Factor
M1130	1.58
M1140	1.80
M1150	1.64
M1160	1.46
M1170	1.54
M1180-M1250	1.25

**Occasional and intermittent service or engine driven applications**

For multi-cylinder engine driven applications and all applications operating intermittently up to 3 hours per day, refer to Table 2 or 3 for the Service Factor of the same application operating 3 to 10 hours per day. Next, in the first column of Table 1, find this same Service Factor in bold face type. Then, to the right, under the desired hours service and prime mover, locate the converted Service Factor.

For example, from Table 3, the Service Factor is 1.25 for a uniformly loaded belt conveyor. From Table 1, for the same application the following are the Service Factors for various conditions.

1. Engine driven 3 to 10 hours per day; use 1.50 Service Factor.
2. Engine driven up to 3 hours intermittently; use 1.25 Service Factor.
3. Motor driven up to 3 hours intermittently; use 1.25 Service Factor.

**MOUNTING POSITION** — Standard mounting positions for types DH & DB are with the input and output shafts horizontal and for DV & DX with the output shafts vertical.

Allowable mounting angles for standard oil levels are;

	Bridge	Slope
DH & DB	0° Up & 4° Down	± 1.5°

Consult the Factory for other angles.

**Drawing Symbols** The following symbols are used throughout the dimensioned drawings.

-  = OIL DIPSTICK
-  = BREATHER
-  = OIL FILL
-  = OIL DRAIN

**Table 2 Mechanical Service Factors listed by Industry**

for electric motor, steam turbine or hydraulic motor drives . . . recommendations are MINIMUM and normal conditions are assumed.

- ★ Service Factors for paper mill applications are applied to the nameplate rating of the electric drive motor at the motor rated base speed and are consistent with those shown in TAPPI standards.
- ◆ Anti-friction bearings only.
- A service factor of 1.25 may be applied at base speed of a paper calender operating over a speed range of part constant power and super constant torque where the constant power speed range is greater than 1.5 to 1. A service factor of 1.25 is applicable to super calenders operating at constant torque over the entire speed range or where the constant power speed range is less than 1.5 to 1.

**Table 3 | Mechanical Service Factors listed by Industry**

Service		Service		Service		Service		
Industry	3 to 10 Hour	Over 10 Hour	Industry	3 to 10 Hour	Over 10 Hour	Industry	3 to 10 Hour	Over 10 Hour
<b>AGITATORS</b>			<b>▲ CONVEYORS—Uniformly loaded or Fed:</b>			<b>▲ HOISTS</b>

▲ Selection of Rexnord products for applications whose primary purpose is the transportation of people is not approved. This includes such applications as freight or passenger elevators, escalators, man lifts, work lift platforms and ski tows and ski lifts.

If the primary purpose of the application is material conveyance and occasionally people are transported, the Factory warranty may remain in effect provided the design load conditions are not exceeded and certification to the appropriate safety codes and load conditions has been obtained by the system designer or end user from the appropriate enforcement authorities.

Contact the Factory for proper selection of a mixer drive.

for electric motor, steam turbine or hydraulic motor drives . . . recommendations are MINIMUM and normal conditions are assumed.

# How to Select/ Formula Method

Before making a selection, refer to Basic Information and Conditions Affecting Selection on Pages 9 and 10.

## Information Required

The following basic information is required to select a Drive One gear drive for your application.

### Prime Mover Data

- Type – electric or hydraulic motor or engine
- Power rating in kW or hp
- Speed – constant or variable
- Dimensions – if the Factory will furnish motor mounting accessory or coupling

### Driven Machine Data

- Type – conveyor, kiln, etc.
- Power demand in kW, or hp, or equivalent torque.
- Speed and direction of rotation
- Service – Hours per day; reversals per minute if reversing; minutes per hour (duty cycle) if not continuous

### Gear Drive Data

- Type – parallel shaft or right angle
- Horizontal or vertical output shaft
- Ambient temperature at drive location
- Altitude above sea level
- Ambient air velocity at drive location
- Mounting position – if inclined or non-standard orientation

### Shaft Connections

- Shaft diameters and key sizes
- Overhung loads – provide full description of sheave, sprocket, or pinion
- Thrust load and direction

## Power Selection Method

The power selection method is based on the power rating of the prime mover.

1. Determine the mechanical service factor.  
Electric motor driven applications, see Tables 2 & 3, Pages 11 & 12.  
Engine driven or intermittent applications, see Table 1, Page 11.
2. Calculate equivalent power by multiplying the rated power of the prime mover by the mechanical service factor determined in Step 1.
3. Determine gear drive nominal ratio.  
Divide the high speed shaft rpm by the low speed shaft rpm to determine your ideal ratio. Choose a nominal ratio that most closely approximates your ideal ratio. Nominal ratios are found in the power ratings tables, see Step 4.
4. Using the equivalent power determined in Step 2, and the gear drive nominal ratio that most closely approximates the ideal ratio determined in Step 3, select the gear drive size using the Power Ratings Tables.  
Power Ratings Tables:  
Parallel shaft gear drives, see Pages 26 thru 35 & 154.  
Right angle shaft drives, see Pages 108 thru 113 & 159.

Locate the proper page within the power ratings tables based on nominal ratio and high speed shaft rpm. Once on the proper page, go to the portion of the table associated with your high speed shaft rpm, and using the appropriate nominal ratio, trace to the right through the columns. Determine the column of the first power rating that equals or exceeds the equivalent power determined in Step 2. The size of the gear drive selected is at the top of the column. Once a gear drive size has been selected, an exact ratio can be determined from the exact ratio tables.

5. Check thermal rating using procedures outlined on Page 14. The application adjusted thermal rating of the cooling method selected must equal or exceed the actual power transmitted.
6. When overhung loads or thrust loads are present, check to assure they are within the capacity of the gear drive selected.

Overhung load (radial load) is imposed by sheaves, sprockets, and open pinions that are mounted directly on the shaft extensions of the gear drive. Gear drive shaft extensions that are flexible coupling connected need not be checked for overhung load, flexible couplings do not impose significant overhung load.

Refer HS shaft overhung load applications to the Factory.

Thrust load (axial load) applied to the gear drive is unusual. In these applications, the magnitude of the thrust load, and the direction of thrust load, is supplied by the system designer. Thrust loads must be within the published capacity of the gear drive.

Refer thrust load applications to the Factory.

Complex shaft loadings involving simultaneous application of overhung load, thrust load, or bending moment (as in mixers and agitators) should be referred directly to the Factory.

## Torque Selection Method

For convenience, low speed shaft torque ratings of gear drives are provided, and a purely mechanical selection of a gear drive can be made using torque values. Simply follow the steps outlined in the power selection method, substituting torque values for power values. In order to check thermal adequacy, and check shaft ratings, it will be necessary to convert the torque to power using the formula below:

$$\text{Input Power (Hp)} = \frac{\text{Torque (lb-in)} \times \text{Output Speed (rpm)}}{63025}$$

## Example Selections

An example using the Power Selection Method and an example using the Torque Selection Method is found on Page 15.

# Thermal Factors & Procedures

## Checking Thermal Rating

Checking the thermal rating is extremely important. If the gear drive's capacity to dissipate thermal energy is insufficient, it will overheat, and severe damage may occur.

Gear drive basic thermal ratings are defined on Page 9. A discussion of application adjusted thermal rating, and when it is applicable, is found on Page 10.

## Thermal Rating Factors

Thermal horsepower ratings published herein are based on a 77°F(25°C) ambient temperature at sea level. For other conditions, the thermal horsepower rating must be multiplied by the factors shown in Tables 1 & 2.

## Application Adjusted Thermal Rating

Once a mechanically adequate gear drive selection has been made per Steps 1-4 on Page 13, determine the application adjusted thermal rating of the gear drive. The application adjusted thermal rating of the gear drive selected must equal or exceed the actual power transmitted.

In most cases, the nameplate power rating of the motor is assumed to equal the actual power transmitted. It is not necessary to apply the mechanical service factor when determining thermal adequacy of a gear drive.

Use the following formula to determine application adjusted thermal rating:

PTA = PT x B1 x B2 x B3 x B4 x B5 x B6 where:

PTA = Application Adjusted Thermal Rating

PT = Basic Thermal Rating

B1 = Ambient Temperature Factor (Table 1)

B2 = Altitude Factor (Table 2)

B3 = Ambient Air Velocity Factor (Table 3)

B4 = Duty Cycle Factor (Table 4)

B5 = Orientation Factor (Table 5)

B6 = Inlet water temperature factor from Table 6 (used only when cooling tubes are selected)

Basic Thermal Ratings for parallel shaft gear drives are found on Pages 36-61.

Basic Thermal Ratings for right angle shaft gear drives are found on Pages 114-125.

**TABLE 6 — Inlet Water Temperature Factor – B<sub>6</sub>**  
(For drives with cooling tubes only)

Inlet Water Temperature	Factor with Cooling Tubes Only
50°F	1.11
60°F	1.05
70°F	1.25
80°F	.94
90°F	.88
100°F	.83

**TABLE 5 — Orientation Factor – B<sub>5</sub> - Horizontal Output Drives Only**

Input Speed rpm	HS Shaft at Same Height as LS Shaft			HS Shaft over LS Shaft			LS Shaft over HS Shaft			1st Int Shaft over HS Shaft
	DH2	DH3	DB3	DH2	DH3	DZ3	DH2	DH3	DZ3	DH3
1750		1.00			0.57			0.29		
1430		1.00			0.66			0.45		
1170		1.00			0.74			0.58		
970		1.00			0.79			0.68		
870		1.00			0.82			0.73		
720		1.00			0.83			0.80		
580		1.00			0.90			0.87		

NOTE: For single reduction (DH1) drives, any orientation other than standard horizontal mounting, requires engineering review and approval. Contact the Factory with complete application details.

For the gear drive you have selected mechanically, choose an auxiliary cooling method whose application adjusted thermal rating equals or exceeds the actual power transmitted. If no listed cooling method is adequate, contact the Factory for selection of an optional heat exchanger, or consider a larger gear drive with greater thermal capacity.

**TABLE 1 — Ambient Temperature Factor – B<sub>1</sub>**  
(For all cooling methods)

Ambient Temperature ★	Factor with no Auxiliary Cooling or with Fan
59°F	1.12
68°F	1.06
77°F	1.00
86°F	0.94
95°F	0.88
104°F	0.81
113°F	0.74
122°F	0.66

★ Factors for other ambient temperatures can be interpolated.

**TABLE 2 — Altitude Factor – B<sub>2</sub>**  
(For air cooled methods, no cooling tubes)

Altitude Above Sea Level – Feet	Factor
0	1.00
2461	0.95
4922	0.90
7382	0.85
9843	0.81
12304	0.76
14765	0.72
17225	0.68

**TABLE 3 — Ambient Air Velocity Factor † – B<sub>3</sub>**  
(For no auxiliary cooling)

Sustained Ambient Air Velocity † ft/sec	Installed Environment	Factor for no Auxiliary Cooling
< 1.6	Confined Space	0.75
1.6 to 4.6	Large Indoor Room	1.00
4.6 to 12.1	Large Indoor Room	1.40
> 12.1	Outdoors	1.90

† The sustained ambient air velocity must be a continuous flow of air directly onto the gear drive. If the air flow cannot be relied upon to be continuous, an ambient air velocity factor of 1.00 must be used.

**TABLE 4 — Duty Cycle Factor ‡ – B<sub>4</sub>**

% Operating Time Per Hour	Factor With or Without Auxiliary Cooling
100%	1.00
80%	1.05
60%	1.15
40%	1.35
20%	1.80

‡ The duty cycle factor must be based on the percentage of each hour that the drive is operating. For example: a gear drive operating for 48 minutes of every hour of the day has an 80% duty cycle, but a drive operating for 4 hours and resting for 4 hours has a 100% duty cycle. Where the % Operating Time Per Hour falls between values tabulated above, use the next higher % Operating Time.

## Power Selection Example

A draw bench operates 10 hours per day. The gear drive required for the application is driven at the high speed shaft by a 100 HP electric motor at 1170 RPM. A low speed shaft speed of 42 RPM at the gear drive has been requested.

Ambient temperature at the draw bench never exceeds 80° F. The draw bench is located in a small indoor room, with air flow less than 1.6 feet per second. Altitude above sea level is 1000 feet. The high speed and low speed shafts of the selected gear drive will be connected to the driving and driven equipment by flexible couplings. Select a base-mounted parallel shaft gear drive for this application as follows:

1. The mechanical service factor is 1.25 for a draw bench drive operating 10 hours per day, from Page 12, Table 3 (Metal Mills).
2. The equivalent power in HP =  $1.25 \times 100 = 125$  HP.
3. The ideal ratio is  $1170 \div 42 = 27.86$ . The closest nominal ratio is 28.0:1 from the Double Reduction Power Ratings Table on Page 28.

4. Using the Double Reduction Power Ratings Table on Page 28, and in the section associated with a nominal ratio of 28.0:1, trace right through the columns to the first power rating that equals or exceeds the equivalent power of 125 HP calculated in Step 2. The selection is a size M1160 (shown at the top of the column) that has a power rating of 143 HP.

Actual mechanical service factor is  $143 \div 100 = 1.43$ .

Exact ratio is 27.36:1, found on Page 69 (exact ratio table)

5. Check thermal rating. The application adjusted thermal rating must equal or exceed the actual power transmitted (100HP).

Basic thermal rating for the size M1160DH2, nominal ratio 28:1, high speed shaft at 1170 RPM, no auxiliary cooling, equals 201 HP, per Page 44.

Thermal factors from Page 14 for no auxiliary cooling are as follows:

B1 = Ambient Temperature Factor from Thermal Table 1 = 1.00

B2 = Altitude factor from Thermal Table 2 = 1.00

B3 = Ambient Air Velocity Factor from Thermal Table 3 = 0.75

B4 = Duty Cycle Factor from Thermal Table 4 = 1.00

B5 = Orientation factor from Thermal Table 5 = 1.00

Application Adjusted Thermal rating with **no auxiliary cooling** =  $201 \times 1.00 \times 1.00 \times 0.75 \times 1.00 \times 1.00 = 151$  THP

Application Adjusted Thermal rating does equal or exceed the 100 HP transmitted, no auxiliary cooling is required.

6. It is not necessary to check overhung load or thrust capacity of the gear drive for this example. Gear drive shaft extensions are connected by flexible couplings, which do not impose significant overhung load. No thrust load is present.

## Torque Selection Example

A dredge utility winch requires 200,000 Lb.-in. of torque at its output shaft, which operates at 16 RPM. The winch is in service 8 hours per day and is driven by a coupling-connected 60 HP, 1750 RPM electric motor. The ambient temperature never exceeds 75° F. The approximate air velocity is 10 feet per second, and the dredge operates in the North Sea (sea level). The winch never operates more than 30 minutes in a given hour. The space available is best suited to a base mounted right angle gear drive. Select a gear drive for this application.

1. The Service Factor is 1.25 for a dredge utility winch operating 10 hours per day, from Page 11, Table 2 under Dredges.
2. The equivalent torque is  $1.25 \times 200,000 = 250,000$  Lb.-in.
3. The ideal ratio is  $1750 \div 16 = 109.4:1$ . The nearest standard nominal ratio is 112:1 from the Right Angle Triple Reduction Table on Page 110.
4. Using the Triple Reduction Table on Page 110, in the 1750 RPM high speed shaft section and at the 112:1 ratio and 16 RPM, trace right to 337 (x 1000, the first torque exceeding the equivalent torque of 250,000 Lb.-in.) and read the drive size M1170 at the top of the column.
5. The basic thermal capacity with no auxiliary cooling for an M1170DB3, 112:1, at 1750 RPM from the table on Page 115 is 126 HP. The ambient temperature factor (B1) from Table 1, Page 14, is 1.00. The altitude factor (B2) from Table 2, Page 14 is 1.00. The ambient air velocity factor (B3) is 1.4 from Table 3, Page 14. The Duty Cycle is 50% (30 min / hour), so the duty cycle factor (B4) is 1.15 from Table 4, Page 14. The Orientation factor (B5) is 1.00, from Table 5, Page 14.
6. The application adjusted thermal capacity is  $126 \times 1.00 \times 1.00 \times 1.40 \times 1.15 \times 1.00 = 202.9$  HP, which exceeds the power rating of the motor (60 HP). Therefore, no additional cooling is required.
7. It is not necessary to check overhung load or thrust capacity of the gear drive for this example. Gear drive shaft extensions are connected by flexible couplings, which do not impose significant overhung load. No thrust load is present.

# Accessory & Option Information

## Shaft Driven Cooling Fans See Pages 173-178

Shaft driven cooling fans provide a simple and inexpensive way to utilize the full mechanical rating of gear drives by lowering the operating temperatures, thus increasing thermal power capacity. Cooling fans have been successfully used on electric motors and other related machinery for many years. They eliminate the need for water or electrically powered cooling, pumps, and external piping. The sound level at standard motor rpm is about the same as that from fans on totally enclosed, fan cooled driving motors. Less than 0.25% of cataloged power rating is required to drive the fans. Shaft driven fans are available for use with DH parallel shaft drives, DB & DZ right-angle drives and also DX vertical drives. Dimensions, arrangements, and clearances for shaft driven fans are shown in this selection guide.

For applications requiring fan cooling and two usable H.S. shaft extensions (with inching drives, emergency drives, etc), consult the Factory.

## Electric Cooling Fans See Pages 180-185

Electric fans are unaffected by shaft rotation and speed, and includes a thermostatic control to turn the fan off when it is not required. The electric fan can be mounted on either end of a parallel shaft drive, and on the L.S. end of a right angle drive. This permits full use of available shaft extensions. Electric fans are available with the following standard motor packages:

- 60 Hz, 3-Phase, 220/380 VAC
- 60 Hz, 3-Phase, 265/460 VAC
- 50 Hz, 3-Phase, 220/380 VAC

Other motor packages may be available at an extra charge. Consult the Factory for price and availability.

Dimensions, arrangements, and clearances for electric fans are shown in this selection guide. Additional information, including motor ratings, and thermostatic control wiring diagrams are also available from the Factory.

## Cooling Tubes - Single Reduction Drives Only See Page 186

Cooling tubes are an economical alternative for thermal requirements that are beyond the capability of fans. A series of straight, finned tubes are provided directly in the oil sump of the drive. Water is circulated through these tubes to cool the oil. Since there are no joints or connections inside the drive, leakage of water into the oil sump is eliminated. The thermal ratings shown in this selection guide are for 70°F(21°C) inlet water temperature.

## Backstops See Pages 192 & 193

Backstops prevent reverse rotation or backrun without backlash for conveyors, elevator head shafts, and similar applications. The Drive One backstop is a sprag type design.

The backstop shares the drive sump oil.

**NOTE: DRIVES WITH BACKSTOPS MUST BE SELECTED WITH A MINIMUM SERVICE FACTOR. SEE TABLE 1A, PAGE 11.**

## Pump & Coolers See Pages 187-191

The integrated oil-to-air cooler is drive mounted at the Factory and is shipped with both the lube suction and return lines connected to the drive with flexible hose. Only one motor is required - this dual output motor drives both the lube pump and cooling fan. The motor is 230-460 Volts, 3 Phase, 50 or 60 Hertz. A thermostatic bypass valve at the cooler regulates the flow of oil through the cooler. Available options include flow switch, single and dual filters.

# Accessory & Option Information

## Motor Brackets

See Pages 198 & 199

Motor brackets may be used for Types DH and DB. These motor brackets provide an economical "soft" mounting for standard NEMA T-frame and IEC B3 induction motors. It is expected that the weight, location, and starting torque of the motor will cause cantilevered motor brackets to deflect or twist to varying degrees. They are engineered to be within acceptable deflection limits as determined by the Factory. However, because the motor bracket is a "soft" motor support, deflection and vibration magnitudes of the bracket may exceed levels normally considered acceptable for rigidly, "hard" mounted machinery.

## Motor Mounts

See Page 202

Motor mounts are selectively pre-designed for Types DH and DB drives. Motor mounts provide a convenient drive support for the motor when the drive is belt driven.

For detailed information on motor mounts, contact the Factory.

## Couplings and Coupling Guards

Rexnord offers a complete line of coupling products, including:

- Falk Steelflex Grid Couplings
- Falk Lifelign Gear Couplings
- Falk Wrapflex and Rex Omega Elastomer Couplings
- Rex Thomas Disc Couplings
- Falk True Torque Fluid Couplings

In addition, Rexnord offers an unmatched variety of Orange Peel coupling guards, meeting OSHA and ANSI safety standards for guarding of rotating equipment

© Rexnord Industries, LLC, 2001, 2009.

## Flange Motor Adapters

See Pages 196 & 197

Flanged motor adapters are available for Types DH and DB drives. This adapter allows a flange-mounted motor to be directly mounted to the high speed side of the drive.

## Bedplates

A bedplate is recommended to insure proper alignment of a base mounted drive with the motor. The Factory can provide fabricated steel bedplates for all popular sizes of standard type DH and DB drives. These bedplates accommodate standard NEMA and IEC motors within the power range of the drive and many of the larger non-NEMA motors. Special bedplates can be designed and manufactured for unique motor and special accessory combinations.

Supports for tachometers, brakes, timing devices, foot-mounted fluid couplings, or other accessories can be added. Contact the Factory for further details on this accessory.

## Swing Base

See Pages 200 & 201

Swing bases have been pre-engineered for over 1000 combinations of Drive One, NEMA & IEC motors, and Falk couplings. Finite element analysis has been performed to assure trouble-free operation. Designed specifically for use with the DBT right angle shaft mounted drive, the swing base provides an economical and readily available alternative to bedplates.

# Accessory & Option Information

## TA Taper Bushings See Page 168

Available with both inch and metric bores, the TA Taper ductile iron bushings provide for easy-on easy-off shaft mounting convenience for hollow shaft drives.

## Torque Arms See Page 200, 201 & 204

Torque arms are available for all shaft mounted Drive One sizes, both DH and DB. They are used to support the drive in a standard horizontal position, and are suitable for use on swing bases, bedplates, Alignment-Free, or mounted directly to the drive. The customer is responsible for determining the structural integrity of their support structure.

## Standard Seals

All shaft extensions have a standard "taconite seal" arrangement consisting of two seals with an external, purgeable grease barrier to prevent abrasive contaminants from reaching the seal lips.

## Shaft Mounting Options

In addition to the TA taper bushing described at left, shaft mounting options include hollow shaft with shrink disc and solid shaft with rigid flange connection.

## Tie Rods See Page 194 & 195

Designed for use with DHT parallel shaft drives, this torque arm consists of two rod ends and a turnbuckle, allowing for some length adjustment.

## Oil Sight Gauge & Oil Drain Valve See Page 207

Provided at the low speed end of the drive. The oil sight gauge allows for quick visual confirmation of correct lubrication levels and the oil drain ball valve simplifies oil changes.

# Accessory & Option Information

## Vertical Drive Features See Pages 94-105 & 144-151

Vertical drives are equipped as standard with a motor-driven lube pump. Also included are a filter and a flow gauge with switch to ensure continuous flow of clean oil to bearings and gears. For positive prevention of oil leaks from vertical down shafts, drive Types DVA, DVM, DXA, and DXM include an internal drywell. Vertical drive options include a ball valve drain and a standpipe oil sight.

## Inching Drives

Inching drives packages are available for inspection of belts, buckets and for cold weather creeping of conveyors. Contact the Factory for selections and details.

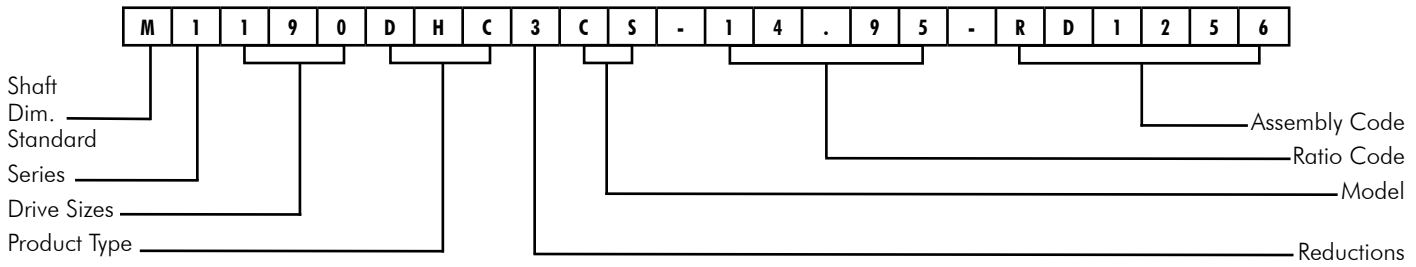

## AirMax Breather & Sealed Dipstick See Page 208

The AirMax breather gives moisture and particulate protection for enclosed gear drives. A sealed dipstick is required for the accessory.

# Drive One Nomenclature

## Shaft Dimensional Standard

M = Standard metric input and output shafts (diameter/bore, length, key & keyway)

## Series

1000 Series

## Drive Sizes

130 thru 250

## Product Type

D = Drive One designation

### Input Shaft/Output Shaft Configuration

- H = Parallel, horizontal L.S. shaft
- B = Right angle, horizontal L.S. shaft (input & output shafts in same plane)
- Z = Right angle, horizontal L.S. shaft (input & output shafts not in same plane)
- V = Parallel, vertical L.S. shaft
- X = Right angle, vertical L.S. shaft (input & output shafts in same plane)

### Output Shaft Type

- C = Solid shaft (cylindrical OD) - All sizes
- T = Hollow shaft (tapered ID)
- Q = Hollow shaft, straight bored & keyed, with keeper plate
- J = Hollow shaft, keyless, with shrink disc
- A = Solid shaft with oversize OD and increased bearing span (Agitator design), includes drywell
- M = Hollow shaft, straight bored and keyed with keeper plate, with increased bearing span (Mixer design), includes drywell

- P = Planetary Secondary, Hollow LS Shaft with Shrink Disc
- R = Planetary Secondary, Solid LS Shaft, for Flange Mounting
- B = Planetary Secondary, Solid LS Shaft, for Foot Mounting
- F = Planetary Secondary, Solid LS Shaft, Moment Connection
- L = Low Ratio / High Thermal, Solid LS Shaft

## Reductions

Number of reductions/Stages in gear drive

## Model

### Model Code 1

Initial Model A. Subsequent models B, C, D, etc.

### Model Code 2

- N = Having no special features or housing rework
- R = Having housing reworked for standard option (e.g. backstop, etc.)
- S = Having special feature or features

## Ratio Code

Exact ratio expressed as (5) characters including decimal point  
Examples: 1.321:1, 14.95:1, 155.7:1, 1196.:1.

## Assembly Code

### Assembly Code 1 - Housing/Shaft Orientation

- T = Horizontal LSS - (HSS above LSS)
- R = Horizontal LSS - (HSS right or left of LSS, Inspection cover down)
- B = Horizontal LSS - (HSS below LSS)
- L = Horizontal LSS - (HSS right or left of LSS, Inspection cover up)
- D = Vertical LSS - L.S. shaft down
- U = Vertical LSS - L.S. shaft up

### Assembly Code 2 - Mounting Arrangement

- A, B, C, D, E, F = Mounted via A, B, C, D, E, F, housing face (see housing faces)
- J = Shaft Mounted Drive (Parallel shaft)
- H = Alignment Free Drive (Right angle shaft)

### Assembly Code 3, 4, 5, 6 - Assembly Number

See assembly figures

### HOUSING/SHAFT ORIENTATION

### MOUNTING ARRANGEMENT

# How to Order

The following information is required to order a Drive One gear drive to meet your application requirements. Much of the information listed below is also used to make a selection and is repeated here in the event a selection will be made by the district office. Note that it is not necessary to specify nomenclature, as described on Page 20, when ordering a Drive One gear drive.

## Gear Drive

- Size, type and ratio.
- High Speed Shaft rpm and Low Speed Shaft rpm.
- Service Factor.
- External shaft loads – thrust and overhung load.
- Factors affecting thermal performance – ambient temperature, altitude, ambient air velocity, duty cycle, gear drive orientation and inlet water temperature (if cooling water is to be used).
- Auxiliary equipment required – couplings, backstops, etc.
- Mounting position and shaft assembly number (see Pages 22-25 for parallel shaft drives and Pages 106 & 107 for right-angle drives).

## Motor – Prime Mover

- Type – motor or engine.
- Power rating – hp .
- Speed – rpm.
- Frame size – dimension prints if the Factory is to furnish mounting surface and/or mount the equipment.
- Motor – type, class, weight, or any special characteristics (such as brake motor, explosion-proof, etc.).
- Identify if motor is to be furnished or installed by the Factory.

## Driven Machine

- Required power or torque.
- Speed – rpm.
- Application description – belt conveyor, agitator, etc.
- Service – duty cycle, hours per day, reversals per minute if reversing.
- Ambient temperature and operating conditions – outdoor, taconite dust, etc.

## Auxiliary Equipment Furnished By The Factory

- Motors – if the Factory is to furnish, provide complete specifications.
- Bedplates – supply drawing of motor and any auxiliary equipment not supplied by the Factory.
- Flange motor adapters or motor brackets – supply drawing of motor.
- Motor mount – supply drawing of motor and the required belt centers and mounting arrangement.
- Backstops – specify direction of rotation of the low speed shaft (CW or CCW) when facing the drive from the end of the exposed low speed shaft extension. Also specify backstop location (right or left side facing HS end).

**NOTE: DRIVES WITH BACKSTOPS MUST BE SELECTED WITH A MINIMUM SERVICE FACTOR. SEE TABLE 1A, PAGE 11.**

- Electric fan position, Hz and volts.
- Couplings – specify size, type, drive and driven hub bores and keyways.
- Coupling guards – furnish description of couplings and/or other equipment to be guarded, and all dimensions A through G below.
- Swing base – supply frame size or drawing of the motor and HS coupling size or shaft gap.

## Special or specification requirements

Advise the Factory of any special project related specifications such as: noise level specifications, bearing L10 requirements, etc.

# Type DHL Parallel Shaft Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DHL Assemblies

### Standard Assemblies

## Type DHL Relative Shaft Rotations ‡

‡ If the input shaft rotation is opposite the rotation shown, the output shaft rotation will also be opposite the rotation shown.

# Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DHC Assemblies

### Standard Assemblies

### Other Available Assemblies

## Type DHC1 Relative Shaft Rotations ‡

‡ If the input shaft rotation is opposite the rotation shown, the output shaft rotation will also be opposite the rotation shown.

## Type DHC2 Relative Shaft Rotations ‡

## Type DHC3 Relative Shaft Rotations ‡

# Type DHT, DHJ, DVA & DVC Parallel Shaft Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DHA & DVC Assembly

## Type DVC Assembly

## Type DHT Assemblies

Standard Assemblies

## Type DHJ Assemblies

Standard Assemblies

## Type DHT2 Relative Shaft Rotations ‡

‡ If the input shaft rotation is opposite the rotation shown, the output shaft rotation will also be opposite the rotation shown.

## Type DHJ2 Relative Shaft Rotations ‡

## Type DHT3 Relative Shaft Rotations ‡

## Type DHJ3 Relative Shaft Rotations ‡

# Type DHQ Parallel Shaft Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DHQ Assemblies

### Standard Assemblies

### Type DHQ2 Relative Shaft Rotations ‡

### Type DHQ3 Relative Shaft Rotations ‡

‡ If the input shaft rotation is opposite the rotation shown, the output shaft rotation will also be opposite the rotation shown.

★ Basic thermal ratings listed are based on an ambient temperature of 77°F(25°C) at sea level. Application adjusted thermal ratings must be calculated using the application adjusted thermal factors on Page 14 before comparing to the required load. For cooling beyond the range of values listed, contact your local district office.

★ Basic thermal ratings listed are based on an ambient temperature of 77°F(25°C) at sea level. Application adjusted thermal ratings must be calculated using the application adjusted thermal factors on Page 14 before comparing to the required load. For cooling beyond the range of values listed, see Pump & Cooler selections on Page 190.

▲ For Type DV, apply a multiplier of 0.8 to the thermal ratings.

Type DV gear drives are not available with shaft fans.

\* Refer to Factory.

★ Basic thermal ratings listed are based on an ambient temperature of 77°F(25°C) at sea level. Application adjusted thermal ratings must be calculated using the application adjusted thermal factors on Page 14 before comparing to the required load. For cooling beyond the range of values listed, see Pump & Cooler selections on Page 190.

▲ For Type DV, apply a multiplier of 0.8 to the thermal ratings.  
Type DV gear drives are not available with shaft fans.

# Type DH, DV & DB Overhung Loads

## Low Speed Shaft

$$\text{Overhung Load (lb)} = \frac{126000 \times \text{hp} \times F_c \times L_f}{\text{Pitch Dia (in)} \times \text{rpm}}$$

**F<sub>c</sub> = Load Connection Factor.**

- Sprocket ★ . . . . . 1.00
- Machined Pinion & Gear ★ . . . . 1.25
- Synchronous (Timing) Belt . . . . 1.30
- V-Belt . . . . . 1.50
- Flat Belt . . . . . 2.50

**L<sub>f</sub> = Load Location Factor.**

- Low Speed Shaft – See table below.
- High Speed Shaft – Refer to Factory.

★ Refer all multiple chain sprocket and pinion mounted applications to the Factory for deflection analysis.

**Overhung Loads** — Overhung load is imposed upon a shaft when a pinion, sprocket or sheave is used as a power takeoff. The magnitude of the load varies with the type of takeoff and its proximity to the shaft bearing. Calculate the load (including minimum required service factor) and check the result against the tabulated overhung load rating. The above overhung load formula considers the transmitted power rating without service factor. This is appropriate for applications where starting loads, momentary overloads and brake capacities do not exceed 200% of drive rating, (100% overload). For other considerations, compute the equivalent power by multiplying the transmitted power by the appropriate service factor.

**Locate the center line of the load** as close to the drive seal cage as practical to minimize the overhung load and increase bearing life.

## Type DH, DV & DB L<sub>f</sub> Load Location Factors ★

### Low Speed Shaft

Based on distance from center line of load to end of shaft

★ Interpolate for intermediate values.

**Consult the Factory for Higher Overhung Load Ratings** — In many cases, overhung load capacity in excess of that published is available. If the actual load should exceed the published capacity, refer full details to the Factory; provide complete application information, as well as direction of rotation, location, and direction of applied load.

**Low Speed Shaft Overhung Load** — Calculate low speed shaft overhung load using the formula and F<sub>c</sub> values at left. The L<sub>f</sub> load location factors tabulated below are based on the distance from the center line of the load to the end of the shaft.

**Example** — A 135 hp, 1170 rpm electric motor, coupling connected to a Drive One Size M1160 drive used to drive a uniformly loaded belt conveyor. The drive is a DH2 configuration mounted on its “D” surface. The drive’s low speed shaft rotates at 75 rpm and is chain connected to the conveyor on the extension opposite the low speed gear. The low speed sprocket has a pitch diameter of 28” and is located 3” from the end of the shaft. Calculate the overhung load as follows :

$$\text{Overhung Load} = \frac{126,00 \times 135 \times 1.00 \times 1.12}{28 \times 75} = 9,072 \text{ lbs}$$

The allowable overhung load for a M1160DH2 drive that is mounted on the “D” surface with extension opposite the low speed gear is found on Page 65. The value for the allowable overhung load is found by interpolating for the given output rpm. The allowable overhung load is 19,000 lbs. The applied overhung load is less than the allowable, therefore, this application is acceptable.

• Overhung load values shown are for loads applied at the center of the extension key length. Published overhung load ratings are based on a combination of the most unfavorable conditions of loading. Consult factory for application specific review if additional capacity is required. Interpolate for values at intermediate speeds. The last overhung load listed applies to all lower output speeds for that drive size and mounting surface.

# Type DBC Right Angle Shaft Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DBC Assemblies

Standard Assemblies

Other Available

## Type DBC Relative Shaft Rotations ‡

Standard Assemblies & Relative Shaft Rotations

Special Assemblies with Opposite Standard Relative Shaft Rotations

‡ If the input shaft rotation is opposite the rotation shown, the output shaft rotation will also be opposite the rotation shown.

# Type DBL Right Angle Shaft Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DBL Assemblies

Standard Assemblies

## Type DBL Relative Shaft Rotations ‡

Standard Assemblies & Relative Shaft Rotations

Special Assemblies with Opposite Standard Relative Shaft Rotations

# Type DBC, DBT, DBJ, DXA & DXC Right Angle Shaft Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DXA & DXC Assembly

L.S. Shaft Down

## Type DXC Assembly

L.S. Shaft Up

## Type DBT Assemblies

Standard Assemblies

## Type DBT Relative Shaft Rotations ‡

## Type DBJ Assemblies

Standard Assemblies

## Type DBJ Relative Shaft Rotations ‡

# Type DBQ Right Angle Shaft Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DBQ Assemblies

Standard Assemblies

## Type DBQ Relative Shaft Rotations ‡

Standard Assemblies & Relative Shaft Rotations

Special Assemblies with Opposite Standard  
Relative Shaft Rotations

‡ If the input shaft rotation is opposite the rotation shown, the output shaft rotation will also be opposite the rotation shown.

# Type DBL Right Angle Shaft

★ Basic thermal ratings listed are based on an ambient temperature of 77°F(25°C) at sea level. Application adjusted thermal ratings must be calculated using the application adjusted thermal factors on Page 14 before comparing to the required load. For cooling beyond the range of values listed, see Pump & Cooler selections on Page 191.

▲ For Type DX, apply a multiplier of 0.8 to the thermal ratings.

Type DB Alignment Free Drive - Sizes M1140-M1230

# Thermal Rating Multiplier

## Multiplier For Alignment Free Drive With Fluid Coupling

DRIVE SIZE ‡	Fluid Coupling/Bell Size			
	1420HFDD	1480HFDD	1584HFDD	1660HFDD
M1140	1.25	...	...	...
M1150	1.25	1.30	...	...
M1160	1.25	1.30	...	...
M1170	1.20	1.25	1.30	...
M1180	1.15	1.20	1.25	1.30
M1190	1.15	1.20	1.25	1.30
M1200	...	1.00	1.15	1.20
M1210	...	1.00	1.15	1.20
M1220	...	...	1.15	1.15
M1230	...	...	1.15	1.15

‡ To determine thermal rating of Drive One Alignment Free Drives, look up the thermal rating for the Type DB right angle shaft with shaft fan and multiply the rating by the value indicated in the table.

## Multiplier For Alignment Free Drive With VFD/Close Coupling

DRIVE SIZE ‡	Motor Frame Size		
	All Sizes (NEMA & IEC)	NEMA 447T/IEC 280M and Smaller Motors	NEMA 449T/IEC 315S and Larger Motors
M1140	1.25	...	...
M1150	1.25	...	...
M1160	1.25	...	...
M1170	...	1.20	1.30
M1180	...	1.15	1.25
M1190	...	1.15	1.25
M1200	1.15	...	...
M1210	1.15	...	...
M1220	1.15	...	...
M1230	1.15	...	...

‡ To determine thermal rating of Drive One Alignment Free Drives, look up the thermal rating for the Type DB right angle shaft with shaft fan and multiply the rating by the value indicated in the table.

# Exact Ratios/Right Angle Shaft Drives

## Double Reduction - Type DBL

Nominal Ratio	DRIVE SIZE

# Selection Procedure for High Torque Drives

Before making a selection, refer to Basic Information and Conditions Affecting Selection on Pages 9 and 10.

## Information Required

The following basic information is required to select a Drive One High Torque gear drive for your application.

### Prime Mover Data

- Type – electric or hydraulic motor or engine
- Power rating in kW or hp
- Speed – constant or variable
- Dimensions – if the Factory will furnish motor mounting accessory or coupling

### Driven Machine Data

- Type – conveyor, kiln, etc.
- Power demand in kW, or hp, or equivalent torque.
- Speed and direction of rotation
- Service – Hours per day; reversals per minute if reversing; minutes per hour (duty cycle) if not continuous

### Gear Drive Data

- Type – parallel shaft or right angle
- Solid or Hollow output shaft
- Base or shaft mounted
- Ambient temperature at drive location
- Altitude above sea level
- Ambient air velocity at drive location
- Mounting position – if inclined or non-standard orientation

### Shaft Connections

- Shaft diameters and key sizes
- Overhung loads – provide full description of sheave, sprocket, or pinion
- Thrust load and direction

## Torque Selection Method

The torque selection method is based on the power rating of the prime mover.

1. Determine the mechanical service factor.

For engine driven or intermittent applications, refer to Factory.

2. Calculate the required output torque (lb-in) using the motor power rating (hp) and the required output speed (rpm).

NOTE: Output speed must not exceed 10 rpm. If output speed exceeds 10 rpm, contact the Factory for selection.

3. Calculate the equivalent torque rating by multiplying the required output torque by the mechanical service factor determined in Step 1.

4. Select the gear drive size from the torque rating table.

Torque Rating Table:

Parallel shaft drives, see Page 154.

Right angle shaft drives, see Page 159.

5. Select the gear drive type and assembly. Parallel shaft, see Page 153 and right angle shaft, see Page 158. Note that for shaft mounted assemblies, the required output shaft direction of rotation determines the torque arm location. For assemblies other than those shown, contact the Factory.
6. Determine the gear drive nominal ratio. Divide the high speed shaft rpm by the low speed shaft rpm to determine your ideal ratio. Choose a nominal ratio that most closely approximates your ideal ratio from the Exact Ratio table. Parallel shaft, see Page 154 and right angle shaft, see Page 159.
7. Check thermal rating using procedures outlined on Page 14. The application adjusted thermal rating must equal or exceed the actual power transmitted.
8. Overhung load (radial load) is imposed by sheaves, sprockets, and open pinions that are mounted directly on the shaft extensions of the gear drive. Gear drive shaft extensions that are flexible coupling connected need not be checked for overhung load, flexible couplings do not impose significant overhung load. Overhung load need not be checked for shaft mounted drives that use a standard torque arm location since the radial and moment loading imposed on these drives are within the capacity of the gear drive. Refer all foot or flange mounted gear drive output shaft overhung loading to the Factory.

Refer all input shaft overhung load applications to the Factory.

Thrust load (axial load) applied to the gear drive is unusual. In these applications, the magnitude of the thrust load, and the direction of thrust load, is supplied by the system designer. Thrust loads must be within the capacity of the gear drive.

Refer all thrust load applications to the Factory.

Complex shaft loadings involving simultaneous application of overhung load, thrust load, or bending moment (as in mixers and agitators) should be referred directly to the Factory.

# Types DHB, DHF, DHP & DHR Parallel Shaft Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DHB Assemblies

Foot Mounted  
Solid LS Shaft

## Type DHR Assemblies

Flange Mounted  
Solid LS Shaft

## Type DHF Assemblies

Shaft Mounted with Torque Arm  
Solid LS Shaft

## Type DHP Assemblies

Shaft Mounted with Torque Arm  
Hollow LS Shaft with Shrink Disc

# Types DHB, DHF, DHP & DHR Parallel Shaft Torque Ratings — lb-in/Quadruple Reduction

DRIVE SIZE ▲	Output Torque Rating ( Output Speed 10 rpm or Less )
M1160	910,000
M1170	1,320,000
M1180	1,845,000
M1190	2,495,000
M1200	3,240,000
M1210	4,050,000

▲ Special order drives are available with output torque ratings greater than 4,050,000 lb-in.

# Types DHB, DHF, DHP & DHR Parallel Shaft Basic Thermal Ratings ★ – Hp/Quadruple Reduction

High Speed Shaft rpm	Nominal Ratio Range	DRIVE SIZE					
		M1160	M1170	M1180	M1190	M1200	M1210

# Types DBB, DBF, DBP & DBR Right Angle Shaft Shaft Assemblies & Rotations

Please specify from the views below, the desired assembly number. Contact the Factory for inclined, wall mounted, or other non-standard orientations.

## Type DBB Assemblies

Foot Mounted  
Solid LS Shaft

## Type DBR Assemblies

Flange Mounted  
Solid LS Shaft

## Type DBF Assemblies

Shaft Mounted with Torque Arm  
Solid LS Shaft

## Type DBP Assemblies

Shaft Mounted with Torque Arm  
Hollow LS Shaft with Shrink Disc

# Types DBB, DBF, DBP & DBR Right Angle Shaft Torque Ratings — lb-in/Quadruple Reduction

DRIVE SIZE ▲	Output Torque Rating ( Output Speed 10 rpm or Less )
M1160	910,000
M1170	1,320,000
M1180	1,845,000
M1190	2,495,000
M1200	3,240,000
M1210	4,050,000

▲ Special order drives are available with output torque ratings greater than 4,050,000 lb-in.

# Types DBB, DBF, DBP & DBR Right Angle Shaft Basic Thermal Ratings ★ – Hp/Quadruple Reduction

High Speed Shaft rpm	Nominal Ratio Range	DRIVE SIZE					
		M1160	M1170	M1180	M1190	M1200	M1210
1750	160 - 280	137	158	201	215	301	301
	315 - 630	101	126	151	173	251	251
1430	160 - 280	131	152	178	216	269	269
	315 - 630	102	126	151	178	251	251
1170	160 - 280	126	151	178	216	269	269
	315 - 630	89	110	151	178	251	251
970	160 - 280	126	151	178	216	269	269
	315 - 630	86	107	151	178	226	226

★ Basic thermal ratings listed are based on an ambient temperature of 25°C (77°F) and an elevation from sea level to 750 meters. Application adjusted thermal ratings must be calculated using the application adjusted thermal factors on Page 14 before comparing to the required load. For auxiliary cooling, contact the Factory.

# Types DBB, DBF, DBP & DBR Right Angle Shaft Exact Ratios – Quadruple Reduction

## Hollow Low Speed Shaft - Shrink Disc Mounted/Dimensions — Inches

The drive package includes the keeper plate and keeper plate retention hardware

Z - QUANTITY  
 ZA - DIA. UNC TAPPED HOLES IN HOLLOW SHAFT  
 ZB - DEEP  
 Y - DIA. BOLT CIRCLE - EQUALLY SPACED HOLES FOR KEEPER PLATE RETENTION

INSTALLATION AND REMOVAL CAN BE ASSISTED THROUGH THE USE OF ADDITIONAL HARDWARE ITEMS SHOWN SHADED (CUSTOMER SUPPLIED)

**INSTALLATION**  
 A THREADED ROD IS INSERTED THROUGH THE KEEPER PLATE CENTER HOLE AND INTO THE TAPPED HOLE IN THE END OF THE DRIVEN SHAFT. THE THREADED ROD, WITH NUT AS SHOWN, ARE USED TO AID ASSEMBLY.

**ASSEMBLED**

**REMOVAL**  
 A FASTENER (LARGER DIA THAN THE THREADED ROD) IS THREADED INTO THE CENTER HOLE OF THE KEEPER PLATE AND IS USED TO SEPARATE THE DRIVEN SHAFT FROM THE HOLLOW LOW SPEED SHAFT OF THE GEAR DRIVE.

## Cooling Tube Clearance/Dimensions — Inches

A minimum flow rate of 2 gallons per minute of clean water is required to prevent tube fouling. The maximum flow rate to prevent tube erosion is 5 gallons per minute. Thermal horsepower ratings are based on a maximum water inlet temperature of 90°F (32°C) with 2 gallons per minute.

★ Dimensions are for reference only and are subject to change without notice unless certified. Available only for use with base-mounted drives; cannot be used with shaft-mounted drives.

NEMA 213T-326T frame brackets are bolted. NEMA 364T-405T frame brackets are welded.

All brackets are slotted.

Shaft driven fans are not available with scoop brackets. Use electric fan if cooling is required.

If a fluid coupling is required, use a swing base or bedplate.

† Dimensions "MB" & "MBB" are to the bottom of the bracket base. Allow extra for motor hardware.  
Negative values for "MB" & "MBB" indicates motor bracket extends below drive feet.

★ Floor mount with input and output shafts on the same horizontal plane. Actual capacities may vary slightly with the ratio. Oil capacities for Sizes M1220-M1250 vary with the ratio and input speed. Contact the Factory.

## Conversion Factors/U.S. Units to SI Metric Units

(Conversion values listed are for reference only. DO NOT use these values to convert or compare inch and metric selection guides.)

DESCRIPTION	U.S. Units	Multiply by to Obtain	SI Metric Units
<b>Force</b>	pound force (lbf)	4.448	newton (N)
<b>Length</b>	inch (in)	25.4	millimeter (mm)
	foot (ft)	0.3048	meter (m)
<b>Mass</b>	pound mass (lbm)	0.4536	kilogram (kg)
<b>Power</b>	horsepower (hp)	0.7457	kilowatt (kW)
<b>Rotational Inertia</b>	pound-inch <sup>2</sup> (lb-in <sup>2</sup> )	0.0002926	kilogram-meter <sup>2</sup> (kg-m <sup>2</sup> )
<b>Rotational Speed</b>	revolutions per minute (rpm)	1	1/min
<b>Temperature</b>	°F	°C = (°F-32)/1.8	°C
<b>Torque</b>	pound-inch (lb-in)	0.113	newton-meter (Nm)
	pound-foot (lb-ft)	1.356	newton-meter (Nm)
<b>Velocity</b>	feet per minute (ft/min)	0.00508	meters per second (m/s)
	miles per hour (mph)	1.609	kilometers per hour (km/h)
<b>Volume</b>	gallon (gal)	3.785	liter (L)
<b>Volumetric Flow</b>	gallons per minute (gal/min)	0.06308	liters per second (L/s)

## Conversion Factors/SI Metric Units to U.S. Units

(Conversion values listed are for reference only. DO NOT use these values to convert or compare inch and metric selection guides.)

DESCRIPTION	SI Metric Units	Multiply by to Obtain	U.S. Units
<b>Force</b>	newton (N)	0.2248	pound force (lbf)
<b>Length</b>	millimeter (mm)	0.03937	inch (in)
	meter (m)	3.2808	foot (ft)
<b>Mass</b>	kilogram (kg)	2.2046	pound mass (lbm)
<b>Power</b>	kilowatt (kW)	1.341	horsepower (hp)
<b>Rotational Inertia</b>	kilogram-meter <sup>2</sup> (kg-m <sup>2</sup> )	3417.6	pound-inch <sup>2</sup> (lb-in <sup>2</sup> )
<b>Rotational Speed</b>	1/min	1	revolutions per minute (rpm)
<b>Temperature</b>	°C	°F = 1.8(°C) + 32	°F
<b>Torque</b>	newton-meter (Nm)	8.850	pound-inch (lb-in)
	newton-meter (Nm)	0.7376	pound-foot (lb-ft)
<b>Velocity</b>	meters per second (m/s)	196.85	feet per minute (ft/min)
	kilometers per hour (km/h)	0.6124	miles per hour (mph)
<b>Volume</b>	liter (L)	0.2642	gallon (gal)
<b>Volumetric Flow</b>	liters per second (L/s)	15.85	gallons per minute (gal/min)

## Equation:

$$\text{Torque (Nm)} = \frac{5950 \times P}{n} \quad \text{Torque (lb - in)} = \frac{63,000 \times P}{n}$$

Where: P = Power (kW); n = shaft speed (rpm)

# World Class Customer Service

For more than 100 years, the dedicated people of Rexnord have delivered excellence in quality and service to our customers around the globe. Rexnord is a trusted name when it comes to providing skillfully engineered products that improve productivity and efficiency for industrial applications worldwide. We are committed to exceeding customer expectations in every area of our business: product design, application engineering, operations, and customer service.

Because of our customer focus, we are able to thoroughly understand the needs of your business and have the resources available to work closely with you to reduce maintenance costs, eliminate redundant inventories and prevent equipment down time.

Rexnord represents the most comprehensive portfolio of power transmission and conveying components in the world with the brands you know and trust.

Rexnord, Drive One, Ultramite, Steelflex, TA Taper and Renew are registered trademarks of Rexnord Industries, LLC. Falk is a trademark of Rexnord. All rights reserved.
